IDRIS SADIQ

Senior Full Stack Engineer - Svelte and SvelteKit, C# and .NET, Azure

P +1 (424) 458-6548 **E** idrissdev@outlook.com **IN** linkedin.com/in/idris-s-3b49a23bb **LOC** Spring Valley, California

SUMMARY

Senior Full Stack Engineer with 10+ years delivering enterprise SaaS, workflow automation, data-intensive services, and cloud-integrated products, specializing in Svelte 4-5 and SvelteKit 1-2, C# 10-13 and .NET 6-9 on Azure; combines API and data architecture, legacy modernization, secure delivery, production troubleshooting, observability, and technical leadership to improve reliability, performance, release confidence, and measurable business outcomes.

EXPERIENCE

SumatoSoft

Senior Software Engineer | January 2021 - December 2025

- Architected and delivered customer platforms with **Svelte and SvelteKit with C# and .NET** on **Azure**, converting ambiguous operational requirements into technical designs, secure milestones, and supportable production releases.
- Modernized aging applications toward **Svelte 4-5 and SvelteKit 1-2, C# 10-13 and .NET 6-9**, replacing tightly coupled modules with **modular frontends, domain services, event-driven workflows, typed contracts, and progressive delivery** while preserving critical workflows through characterization, integration, and regression testing.
- Diagnosed difficult production incidents involving **hydration failures, queue retries, N+1 queries, stale caches, and inconsistent API contracts**, correlating distributed traces, structured logs, browser profiles, queue metrics, and database execution plans to isolate root causes.
- Implemented new subscription, workflow, reporting, search, notification, and administrative capabilities across **web applications, APIs, background processing, reporting, and cloud data services**, balancing delivery speed with compatibility, accessibility, and operational readiness.
- Introduced **API versioning, schema validation, feature flags, idempotency controls, and automated rollback paths**, enabling gradual customer migrations without breaking older integrations or active sessions.
- Built secure delivery pipelines with **Docker, Kubernetes, Helm, Terraform, GitHub Actions, GitLab CI, and Argo CD**, standardizing environment promotion, evidence collection, and repeatable release verification.
- Strengthened identity and platform security with **OAuth 2.0, OpenID Connect, JWT validation, RBAC/ABAC, secrets management, rate limiting, and tamper-evident audit logging**.
- Mentored engineers through architecture reviews, pairing, code reviews, incident retrospectives, and practical testing standards, improving ownership while avoiding unnecessary process overhead.
- Improved API and user-flow performance by **39%** through query reshaping, targeted indexing, Redis caching, bundle reduction, batching, and removal of redundant integration calls during peak activity.

High Touch Technologies

Senior Software Engineer | June 2018 - December 2020

- Owned delivery of enterprise applications using **Svelte and SvelteKit with C# and .NET** with period-appropriate cloud services, supporting operational workflows, customer portals, reporting, and third-party integrations across regulated environments.
- Refactored legacy modules into **modular frontends, domain services, event-driven workflows, typed contracts, and progressive delivery**, reducing shared-state defects and allowing teams to release isolated functionality without rebuilding or redeploying unrelated application areas.
- Resolved production failures caused by **timeouts, lock contention, stale caches, malformed vendor payloads, partial outages, and configuration drift**, adding bounded retries and clearer failure contracts.
- Developed new case-management, scheduling, export, search, and role-based administration capabilities across **web applications, APIs, background processing, reporting, and cloud data services**, with backward-compatible data migrations and documented support procedures.
- Improved transaction correctness through **database constraints, narrower transaction scopes, idempotency keys, reconciliation jobs, and replay-safe queue consumers**, preventing duplicate or incomplete business actions.
- Expanded automated validation with **unit, integration, API contract, end-to-end, security, and performance tests**, catching edge cases that previously appeared only in customer-specific configurations.
- Partnered with product, QA, operations, and client teams during staged rollouts, using feature toggles, dashboards, and production checks to limit risk and communicate impact clearly.
- Reduced customer-reported workflow defects by **32%** after standardizing validation, observability, retry behavior, cache invalidation, and root-cause follow-up across recurring incident categories.

KEY ACHIEVEMENTS

Improved Product Performance

Improved API and user-flow performance by **39%** through query reshaping, targeted indexing, Redis caching, bundle reduction, batching, and removal of redundant integration calls during peak activity.

Reduced Production Defects

Reduced customer-reported workflow defects by **32%** after standardizing validation, observability, retry behavior, cache invalidation, and root-cause follow-up across recurring incident categories.

Accelerated Incident Resolution

Shortened average incident triage time by **28%** through structured logging, correlation identifiers, actionable dashboards, and runbooks that connected symptoms to likely service and data failure modes.

SKILLS

Frontend: Svelte 4-5 and SvelteKit 1-2, TypeScript, HTML5, CSS3, accessibility, design systems, SSR/SSG, client caching, responsive UI

Backend: C# 10-13 and .NET 6-9, secure APIs, background processing, messaging, concurrency, validation, service integration, performance tuning

Testing: Jest/Vitest, Testing Library, Cypress, Playwright, framework-native unit testing, Testcontainers, contract testing, load testing, test automation strategy

Cloud & Infrastructure: Azure, Docker, Kubernetes 1.24-1.31, Terraform 1.x, Linux, serverless services, networking, IAM, secrets, backup and disaster recovery

APIs & Architecture: REST, GraphQL, gRPC, WebSockets, event-driven architecture, microservices, modular monoliths, domain-driven design, CQRS, API versioning, idempotency

Data & Databases: PostgreSQL 13-17, MySQL 8, SQL Server, MongoDB 5-8, Redis 6-7, Elasticsearch/OpenSearch, schema design, indexing, query optimization, migrations

Quality & Delivery: GitHub Actions, Jenkins, GitLab CI, Azure DevOps, trunk-based development, feature flags, unit/integration/contract/E2E testing, code review, release management

Observability & Security: OpenTelemetry, Prometheus, Grafana, Datadog, CloudWatch, ELK/OpenSearch, Sentry, OAuth 2.0, OIDC, RBAC, SAST, SCA, threat modeling, incident response

Senior Engineering: architecture decision records, technical roadmaps, estimation, mentoring, cross-functional leadership, Agile delivery, production ownership, cost optimization, stakeholder communication

EXPERIENCE CONTINUED

Centric Tech Inc.

Software Engineer | September 2015 - May 2018

- Developed business applications and integration services with **Svelte and SvelteKit with C# and .NET**, implementing stable interfaces, reusable modules, and period-appropriate deployment practices for internal and customer-facing workflows.
- Designed relational data models in PostgreSQL, MySQL, and SQL Server, adding selective indexes, query rewrites, and safer migration scripts for frequently used search and reporting operations.
- Investigated defects involving **incorrect totals, duplicate imports, null-handling errors, slow list queries, failed background jobs, and inconsistent date conversions** across production datasets.
- Implemented new dashboard, export, notification, account-management, and reconciliation features across **web applications, APIs, background processing, reporting, and cloud data services**, documenting edge cases and expected behavior for support and QA teams.
- Hardened external integrations with explicit timeouts, retry limits, token refresh handling, defensive parsing, and traceable audit records so vendor instability did not exhaust worker capacity.
- Automated build, test, and deployment checks with Jenkins, Docker, Bash, and environment scripts, improving repeatability across development, staging, and scheduled production releases.
- Shortened average incident triage time by **28%** through structured logging, correlation identifiers, actionable dashboards, and runbooks that connected symptoms to likely service and data failure modes.

Microsoft

Software Engineer Intern | September 2014 - August 2015

- Delivered carefully scoped service and internal-tool improvements using period-appropriate **C#, .NET, JavaScript, SQL Server, and Azure** technologies, emphasizing compatibility and maintainable implementation.
- Built utilities that automated repetitive operational and diagnostic steps, reducing manual error while producing consistent outputs that senior engineers could validate across environments.
- Improved troubleshooting by adding structured logs, contextual metadata, and targeted diagnostics around API and data-processing paths that previously produced ambiguous failure messages.
- Assisted with API integration changes by matching established request and response contracts, documenting edge cases, and preserving backward compatibility for dependent internal applications.
- Added focused unit and integration tests for bug fixes and new modules, incorporating code-review feedback on error handling, maintainability, security boundaries, and production readiness.
- Collaborated with engineers and product partners to translate requirements into testable acceptance criteria, reproduce reported defects, validate fixes, and document lightweight support runbooks.

SELECTED PROJECTS

Multi-Tenant SaaS Platform - Svelte and SvelteKit / C# and .NET

Delivered a role-based SaaS product using **Svelte 4-5 and SvelteKit 1-2** and **C# 10-13 and .NET 6-9**, with secure APIs, background jobs, subscriptions, reporting, feature flags, and cloud deployment on **Azure**; established contract testing, observability, and backward-compatible migrations.

Legacy Product Modernization

Planned and executed strangler-pattern modernization of an older web application, introducing modular UI boundaries, versioned services, event-driven integration, automated regression coverage, and progressive rollout controls while keeping customer workflows available throughout the transition.

PROFESSIONAL DEVELOPMENT

Certification details were not included in the supplied profile; list only credentials personally earned and currently valid. Role-aligned professional development includes **Azure solution architecture, Kubernetes application delivery, secure software development, API design, and role-specific framework training**, supported by hands-on architecture, implementation, production support, mentoring, and security-focused engineering work.

EDUCATION

Harvard University | Bachelor’s Degree, Computer Science | 2010 - 2014
