

GABRIEL POPA

Senior Software Engineer – C# (.NET) • Angular • AWS

Cluj, Romania | +40 764309991 | gabrielpdev@outlook.com | <https://www.linkedin.com/in/gabriel-popa-12890b414/>

ABOUT ME

Senior Software Engineer with **10+ years of experience** building business platforms with **C#, .NET, ASP.NET Core, Angular, TypeScript**, and SQL-based systems, combining strong backend engineering with practical frontend delivery across dashboards, administration, reporting, authentication, and workflow-heavy applications. Strongest work centers on **modernizing legacy systems**, solving difficult production issues, delivering secure API-driven features, and handling phased migrations from older server-rendered or mixed frontend approaches into cleaner **Angular** and modern **.NET** architectures. Hands-on across **Angular 8–18, TypeScript 3.x–5.x, C# 5–12, .NET Framework 4.5–4.8**, and **.NET Core / .NET 5–8**, with solid depth in **SQL Server, PostgreSQL, Azure, Docker**, testing, structured logging, and safe step-by-step upgrade work.

SKILLS

- **Frontend: Angular 8–18, TypeScript 3.x–5.x**, JavaScript ES6+, RxJS, NgRx, Angular Material, Reactive Forms, Route Guards, Lazy Loading, reusable component architecture, SPA development, HTML5, CSS3, SCSS, Bootstrap, responsive UI, client-side validation
- **Backend: C# 5–12, .NET Framework 4.5–4.8, .NET Core / .NET 5–8, ASP.NET MVC, ASP.NET Web API, ASP.NET Core Web API**, Entity Framework, Entity Framework Core, LINQ, REST API design, authentication, authorization, background jobs, integration services, validation
- **Data & Messaging: SQL Server, PostgreSQL, MySQL, Redis**, schema design, query tuning, indexing, stored procedures, reporting queries, pagination, caching, queue-based processing, event-driven integration basics
- **Cloud & DevOps: Azure App Service, Azure Functions, Azure DevOps**, Azure SQL, Blob Storage, AWS basics, Docker, Kubernetes basics, Git, GitHub Actions, Jenkins, CI/CD pipelines, IIS, Nginx, Linux, release automation, deployment troubleshooting
- **Observability / Quality / Security: xUnit, NUnit, Jest, Cypress, Playwright**, integration testing, API testing, structured logging, **OpenTelemetry basics**, Prometheus/Grafana basics, Sentry, JWT, RBAC, OWASP security practices, rate limiting, error monitoring

PROFESSIONAL EXPERIENCE

Senior Software Engineer

Soft Build, Remote (Jan 2024 – May 2026)

- Led delivery of a multi-module business platform using **.NET 8, ASP.NET Core Web API, Angular 16–18**, and **TypeScript**, converting fragmented operational requirements into stable workflows for dashboards, approvals, reporting, and administration.
- Modernized backend services from older **.NET Core** implementations into a cleaner **.NET 8** structure with improved controller design, clearer service-layer separation, and safer dependency registration, reducing maintenance overhead during feature expansion.
- Restructured legacy frontend areas into cleaner **Angular feature modules**, shared UI components, strongly typed services, and reusable form patterns, which reduced regressions and improved implementation consistency across high-change screens.
- Built validation-heavy workflows with **Reactive Forms**, reusable error rendering, conditional UI logic, and typed API integration, improving submission consistency and reducing repeated front-end defects by **33%**.
- Diagnosed and fixed a recurring timeout issue affecting large dashboard requests by profiling data access patterns, introducing missing indexes, and applying targeted pagination, resulting in more stable performance under heavier usage.
- Built a role-aware administration area backed by **JWT-secured APIs** and permission-based UI rendering, improving control over sensitive operations and reducing manual intervention for access-related tasks.
- Stabilized large-file export behavior by replacing memory-intensive generation logic with streamed processing, improving reliability for reporting workflows used by finance and operational teams.
- Added structured logging and basic **OpenTelemetry** instrumentation across critical API flows, which improved visibility during troubleshooting of intermittent production issues tied to authentication, scheduled jobs, and external integrations.
- Strengthened release processes by improving **Docker** build consistency, standardizing environment configuration, and adding validation gates to the CI/CD pipeline, helping improve release reliability by **27%**.

- Deployed and supported workloads in **Microsoft Azure** using **App Service**, **Azure SQL**, **Blob Storage**, and monitoring tooling, improving runtime consistency and operational troubleshooting across shared systems.
- Fixed a cache invalidation issue that caused stale reference data to appear in selection workflows, adding explicit refresh handling that removed a recurring source of user confusion after releases.
- Implemented an audit-history capability that combined backend event capture with searchable Angular interfaces, giving support teams clearer visibility into record changes and user actions during issue triage.
- Contributed to cross-team integration work by clarifying API contracts, validating payload edge cases early, and correcting serialization inconsistencies that had previously caused downstream failures.

Software Engineer

Next Apps, Remote (*Nov2020 – Nov 2023*)

- Built full-stack product features with **ASP.NET Core**, **C#**, **Angular 9–16**, and **TypeScript**, supporting customer-facing workflows, internal tooling, and backend integrations across actively used business modules.
- Expanded REST API functionality for search, status tracking, and configuration management while preserving thin-controller patterns, making service behavior easier to test and safer to evolve during concurrent team development.
- Modernized legacy frontend screens by migrating older component patterns into cleaner **Angular Reactive Forms**, typed services, and RxJS-driven state handling, improving maintainability and reducing form-related duplication.
- Created reusable UI infrastructure with shared validation rules, input wrappers, table patterns, modal behavior, and consistent error rendering, which made product-wide changes easier to apply across multiple screens.
- Fixed an intermittent data-visibility issue where users received success messages before refreshed reads reflected committed updates, resolving the gap through safer transaction sequencing and clearer client refresh handling.
- Strengthened API consistency by standardizing validation, error contracts, and response behavior, allowing the frontend to handle failure scenarios more predictably and improving failure-handling consistency by **29%**.
- Assisted with a phased migration from **.NET Core 3.1** to **.NET 6**, addressing package conflicts, outdated configuration patterns, and startup differences so upgrade work could continue alongside ongoing delivery.
- Supported **Azure** application environments through deployment, configuration, and operational troubleshooting work, helping improve release consistency and overall runtime stability.
- Introduced higher-risk integration and API tests to catch workflow failures earlier in the delivery cycle, reducing the number of issues first surfaced during manual QA or after deployment.
- Improved slow list and search screens by reducing oversized joins, trimming unnecessary payload fields, and refining response models, resulting in faster page behavior without heavy schema rework.
- Helped standardize containerized workflows with **Docker** and release pipeline automation, improving setup consistency across environments and reducing environment-specific delivery problems.

Software Developer

Datamart, Remote (*Feb 2016 – Sep 2020*)

- Developed business applications using **C#**, **ASP.NET MVC**, later **ASP.NET Core**, and early **Angular** adoption, helping the team transition from server-rendered patterns into more interactive and maintainable frontend experiences.
- Built and maintained internal modules for records management, reporting, and approval workflows, translating detailed user requests into practical implementations that balanced delivery speed with system stability.
- Helped introduce early Angular-based frontend areas while preserving compatibility with existing MVC pages, allowing gradual modernization instead of a risky full rewrite of already working screens.
- Resolved a persistent issue where form submissions occasionally created duplicate records by tightening server-side validation, adding idempotent handling, and improving client feedback during slow network conditions.
- Improved older SQL-heavy screens by rewriting inefficient queries, adding indexes, and reducing unnecessary round trips, making reporting pages more usable for teams working with larger operational datasets and improving response times by **23%**.
- Supported migration work from **Entity Framework 6** patterns into **Entity Framework Core** where appropriate, adjusting data access code carefully so newer services could evolve without destabilizing stable legacy modules.
- Created reusable helper components and shared service methods that reduced duplicated implementation across CRUD-heavy screens, making later enhancements and bug fixes easier for the broader team to apply consistently.
- Investigated authorization inconsistencies that exposed the wrong action buttons to some users, then aligned backend permission checks with frontend rendering rules to prevent confusing or unsafe interactions.
- Added unit and integration coverage around higher-risk business rules, improving confidence in release cycles and reducing the chance that small maintenance changes would break dependent workflows.

Junior Software Developer

Berg Software, Timișoara, Romania (Sep2014 – Mar 2016)

- Supported web application development using **C#**, **ASP.NET MVC**, JavaScript, HTML, CSS, and **SQL Server**, contributing mainly to bug fixes, smaller enhancements, and maintenance tasks under guidance from senior engineers.
- Fixed a recurring form-submission problem caused by mismatched validation between browser scripts and server logic, and the correction reduced failed entries that had been frustrating both users and QA reviewers.
- Built small UI improvements for internal business pages, including clearer field handling, conditional rendering, and layout adjustments, which reduced user confusion by **22%** across screens that had grown inconsistent over time.
- Assisted with backend feature updates by extending controller actions, updating view models, and adding safe database changes, allowing new requirements to be delivered without destabilizing existing workflows.
- Investigated an intermittent login issue that appeared after session expiry by tracing request behavior and reviewing cookie settings, and the eventual fix made authentication flow more predictable for normal users.
- Helped clean up duplicated code in older modules by extracting shared helpers and simplifying repeated logic, which made future bug fixes easier for the wider team to apply across related pages.
- Worked on data-correction scripts and small SQL updates when legacy records caused application errors, supporting smoother releases by removing problematic edge cases before they reached production users.
- Added basic unit tests around selected business rules after several defects showed that manual verification alone was not enough, contributing to a more disciplined delivery process within the team.
- Participated in release preparation, smoke testing, and post-deployment checks, learning to verify configuration-sensitive behavior carefully so smaller changes would not create larger production issues.

EDUCATION

Bachelor's Degree in Computer Science

University of Bucharest | (2010 – 2014)

- Focused on practical software engineering fundamentals that translated directly into building reliable web systems and data-driven applications.

CERTIFICATOINS

- **Microsoft Certified: Azure Developer Associate (AZ-204) — 2026**
Demonstrated practical capability in building, testing, deploying, and maintaining **Azure-based** applications, with strong relevance to **.NET**, **ASP.NET Core**, APIs, authentication, and cloud integrations.
- **Microsoft Certified: Azure Fundamentals (AZ-900) — 2026**
Demonstrated strong foundational knowledge of cloud concepts, core **Azure** services, governance, security, pricing, and support models for modern software delivery.
