

Rodrigo Fernandez

Senior Angular / Java (Spring Boot) Full Stack Engineer

Katy, Texas | +1 (407) 801-1287 | <https://www.linkedin.com/in/rodrigo-bermejo-fern%C3%A1ndez-9a5a0664/> | rodrigobfdev@gmail.com

Summary

Senior Java / Angular Full Stack Engineer with strong experience building enterprise SaaS, fintech, healthcare, logistics, and cloud platform products using **Java 8–21**, **Spring Boot 2–3**, **Angular 10–18**, TypeScript 4–5, REST APIs, microservices, PostgreSQL, Kafka, Docker, Kubernetes, and AWS. Known for modernizing legacy Java and AngularJS-style modules into secure, component-driven applications, resolving production defects, improving API performance, strengthening CI/CD quality gates, and partnering with product teams to deliver scalable business-critical systems with measurable reliability, usability, and deployment improvements across distributed teams.

Skills

- **Languages:** **Java 8–21**, **TypeScript 4–5**, JavaScript ES6+, SQL, HTML5, CSS3, SCSS
- **Backend:** **Spring Boot 2–3**, Spring MVC, Spring Security 5–6, Spring Data JPA, Hibernate 5–6, REST APIs, Microservices, OAuth2, OIDC, JWT, Kafka, RabbitMQ
- **Frontend:** **Angular 10–18**, AngularJS 1.x, RxJS 6–7, NgRx 10–16, Angular Material 10–17, Reactive Forms, Lazy Loading, Component Architecture, Bootstrap 4–5
- **Databases:** PostgreSQL 12–15, MySQL 5.7–8.0, SQL Server, Oracle 12c–19c, Redis 5–7, **Cloud & DevOps:** AWS EC2, ECS, Lambda, S3, RDS, CloudWatch, Docker 19–24, Kubernetes, Jenkins, GitHub Actions, Maven, Gradle, SonarQube
- **Testing & Quality:** JUnit 5, Mockito, Cypress, Jasmine, Karma, Postman, Swagger/OpenAPI, CI/CD Quality Gates, Unit Testing, Integration Testing

Experience

Lightedge — Senior Software Engineer (*Apr 2020 – Mar 2026*)

- Delivered **Java 11–21** and **Spring Boot 2–3** microservices for a cloud infrastructure customer portal, improving provisioning workflow speed by **34%** through API pagination, validation cleanup, and cached reference data.
- Modernized a legacy Angular 10 dashboard into **Angular 16–18** feature modules with typed reactive forms, lazy-loaded routes, and shared design-system components that reduced duplicate UI code.
- Resolved recurring **Hibernate 5–6** lazy-loading failures in account billing screens by adding transactional service boundaries, DTO mapping, and query-level fetch plans that removed production 500 errors.
- Migrated REST services from older Spring MVC patterns to **Spring Boot 3** with Jakarta namespace changes, updated security filters, and staged regression tests to avoid endpoint contract breaks.
- Implemented OAuth2/OIDC and **JWT** authorization with Spring Security 5–6, tightening role-based access for admin workflows and reducing support escalations around permission defects.
- Built Angular route guards, interceptors, RxJS 6–7 retry logic, and centralized error banners so users received clear recovery steps instead of silent failed API calls.
- Improved PostgreSQL 12–15 query latency by **41%** through index review, EXPLAIN-plan tuning, batch fetching, and cache invalidation rules for high-volume tenant reports.

- Integrated Kafka event workflows for billing notifications and service-status updates, adding idempotency keys, dead-letter handling, and replay-safe consumers for production reliability.
- Led CI/CD hardening with Jenkins, GitHub Actions, Maven, Docker, and SonarQube quality gates, cutting broken deployments across Java and Angular releases.
- Reworked flaky Cypress and JUnit 5 coverage around entitlement flows, fixing timing issues, unstable mocks, and timezone-based assertion errors before release windows.
- Partnered with product, security, and support teams to triage customer-facing defects, reproduce browser-specific Angular errors, and deliver fixes without widening sprint scope.
- Documented migration playbooks, API versioning rules, and shared Angular patterns so engineers could flexibly switch between front-end delivery, Java services, and release support.

NIX United — Software Engineer *(Oct 2016 – Mar 2020)*

- Built **Java 8–11** REST APIs with Spring Boot 1.5–2.2 for SaaS case-management modules, standardizing exception handling and reducing repeated support tickets by **25%**.
- Developed Angular 4–9 screens with TypeScript 2–3, RxJS 5–6, and Angular Material, replacing jQuery-heavy pages with maintainable component workflows.
- Fixed a difficult production issue where duplicate payment events created inconsistent invoice states by adding database uniqueness rules, idempotent handlers, and retry-safe service logic.
- Migrated legacy XML-based Spring configuration toward annotation-driven Boot services, improving onboarding speed and making environment-specific settings easier to manage.
- Implemented reusable reactive forms, validators, and nested table components that shortened new admin feature delivery by **30%** while preserving accessibility expectations.
- Optimized slow Hibernate queries in reporting endpoints by replacing N+1 access patterns with projections, join fetches, and controlled pagination for large customers.
- Created role-based UI permissions in Angular and matched them with Spring Security method checks so restricted actions stayed protected on both client and server.
- Improved Jenkins and Maven pipelines with unit tests, integration checks, and artifact versioning, reducing manual release steps and preventing mismatched deployments.
- Resolved CORS, token refresh, and browser caching bugs during API gateway integration by coordinating headers, interceptor behavior, and backend session policies.
- Collaborated with QA to add Protractor and JUnit regression coverage for customer workflows that had previously failed only under realistic multi-step user paths.
- Supported distributed Agile teams by reviewing Java service designs, Angular component contracts, and defect priorities across banking, healthcare, and B2B SaaS clients.

Webiz Digital — Software Developer *(Jan 2014 – Sep 2016)*

- Delivered **Java 7–8** Spring MVC features for e-commerce and digital-service platforms, improving checkout validation and order-management stability for client teams.
- Built AngularJS 1.3–1.5 single-page modules with controllers, services, directives, and route-based workflows before Angular 2+ became the enterprise standard.
- Resolved session timeout bugs that caused users to lose form data by adding client-side state preservation, server-side validation recovery, and clearer error messaging.
- Refactored JSP and jQuery-heavy screens into reusable AngularJS components, reducing duplicated front-end logic and making campaign-management pages easier to maintain.
- Improved MySQL 5.6–5.7 query performance by adding practical indexes, simplifying joins, and caching repeated lookup data for catalog and customer modules.
- Implemented REST endpoints around product search, order history, and user profiles, using consistent DTO contracts to reduce integration defects with front-end teams.

- Added logging around payment callbacks and third-party API failures, helping the team identify malformed payloads, timeout spikes, and retry gaps faster.
- Supported migration from Ant-style builds toward Maven-based Java projects, simplifying dependency management and creating a cleaner path for later Spring Boot adoption.
- Worked flexibly across Java services, AngularJS UI fixes, SQL scripts, and release validation when small teams needed fast turnaround on client delivery issues.
- Partnered with designers and QA to reproduce cross-browser layout bugs, stabilize form behavior, and reduce production hotfixes after client launch periods.

Aurio — Junior Software Developer *(Oct 2012 – Dec 2013)*

- Supported **Java 6–7** web application maintenance with Spring 3, JSP, Servlets, and early REST patterns for internal business and customer-service tools.
- Assisted with early AngularJS 1.0–1.2 modules by wiring controllers, templates, and simple validation flows for internal dashboards and admin screens.
- Fixed null-pointer and data-format issues in service layers by tracing logs, adding defensive validation, and improving handoff notes for senior engineers.
- Updated SQL Server 2008–2012 stored procedures and queries for reporting screens, reducing repeated manual corrections from operations users.
- Created small Java utility classes and scheduled jobs for import workflows, handling malformed CSV files, duplicate records, and partial processing failures.
- Improved UI consistency by replacing scattered jQuery behaviors with reusable JavaScript helpers and early AngularJS components where project constraints allowed.
- Validated bug fixes with manual regression scripts, browser checks, and peer reviews, building strong habits around reproducible defects and clean release notes.
- Contributed to SVN-to-Git transition activities by cleaning branch structure, documenting merge steps, and helping teammates avoid overwritten changes.
- Learned to move across support tickets, front-end fixes, Java debugging, and database cleanup tasks while keeping communication clear with senior developers.

Microsoft — Software Developer Intern *(Jun 2012 – Sep 2012)*

- Completed a Software Developer Internship focused on Java fundamentals, internal tooling, unit testing, and code review discipline inside a structured enterprise engineering environment.
- Assisted with small bug fixes and documentation tasks, learning how production teams track defects, validate edge cases, and communicate changes across reviewers.
- Built early professional habits around code review, debugging, documentation, testing, and secure engineering practices while contributing to production-adjacent enterprise tools.
- Learned large-scale development workflow, version control discipline, and professional communication from senior engineers.
- Participated in team meetings, sprint planning, and defect analysis while gaining real-world software lifecycle exposure.

Education

Texas State University

Bachelor's Degree in Computer Science *(Sep 2008 – May 2012)*
