

Kristine Stanley

Senior Software Engineer | .NET & Vue.js

Coaldale, CO 81222 | kristine.stanley.dev@outlook.com | +1 (786) 949-7561 | <https://www.linkedin.com/in/kristine-stanley-341688411>

PROFESSIONAL SUMMARY

Senior Software Engineer with 11+ years delivering cybersecurity, connected-mobility, insurance, and learning-platform products using **C#, .NET Framework 4.5–4.8, .NET Core 2.1–3.1, .NET 6–8, Vue 2–3, TypeScript, SQL Server, PostgreSQL, Azure, and AWS**; combines secure API architecture, responsive frontend engineering, cloud modernization, observability, and technical leadership to improve reliability, delivery speed, developer productivity, and customer outcomes.

SKILLS

- **Languages:** C#, TypeScript, JavaScript ES6+, SQL, PowerShell, Bash, HTML5, CSS3
- **Microsoft Technologies:** .NET Framework 4.5–4.8, .NET Core 2.1–3.1, .NET 6–8, ASP.NET Core, ASP.NET MVC 5, Web API, Minimal APIs, Entity Framework Core, LINQ, SignalR, MediatR
- **Vue.js:** Vue 2–3, Nuxt 2–3, Composition API, Options API, Pinia, Vuex, Vue Router, VueUse, Vite, Webpack, Storybook, Vuetify, PrimeVue
- **API Development:** REST, GraphQL, OpenAPI, Swagger, gRPC, WebSockets, SignalR, webhooks, API versioning, rate limiting, OAuth 2.0, OpenID Connect, JWT, RBAC
- **Architecture:** Microservices, modular monoliths, clean architecture, domain-driven design, CQRS, event-driven architecture, transactional outbox, backend-for-frontend, multi-tenant systems
- **Databases:** SQL Server, PostgreSQL, MySQL, MongoDB, Azure Cosmos DB, Amazon DynamoDB, Redis, Entity Framework Core, Dapper, migrations, indexing, query optimization
- **Messaging:** Apache Kafka, RabbitMQ, Azure Service Bus, AWS SQS, MassTransit, dead-letter queues, retry policies, message deduplication, event replay, idempotent consumers
- **Cloud Platforms:** Azure App Service, Azure Functions, AKS, Service Bus, Key Vault, Azure SQL, Cosmos DB, Application Insights; AWS Lambda, ECS, EKS, RDS, S3, SQS
- **Testing:** xUnit, NUnit, Moq, FluentAssertions, Testcontainers, WireMock.Net, Vitest, Jest, Vue Test Utils, Cypress, Playwright, Pact
- **DevOps:** Docker, Kubernetes, Terraform, Bicep, Helm, Azure DevOps, GitHub Actions, Jenkins, SonarQube, NuGet, npm, pnpm, CI/CD pipelines
- **Monitoring:** OpenTelemetry, Serilog, Application Insights, Datadog, Prometheus, Grafana, ELK Stack, Sentry, structured logging, distributed tracing
- **Senior Practices:** Technical leadership, architecture reviews, mentoring, code reviews, production support, incident response, root-cause analysis, Agile delivery, stakeholder communication

EXPERIENCE

Veracode Systems Inc — Senior Software Engineer

Remote/ Full time

April 2021 – May 2026

Somerville, MA

- Led architecture and delivery for enterprise application-security products using **.NET Core 3.1**, later **.NET 6–8, ASP.NET Core, Vue 2–3, TypeScript**, and **PostgreSQL** across vulnerability management, policy evaluation, analytics, reporting, and remediation workflows.
- Reorganized tightly coupled controllers, shared service classes, and duplicated Vuex state into domain-focused services, **MediatR** pipelines, reusable composables, and **Pinia** stores, reducing recurring production defects by **36%**.
- Resolved dashboard freezes and slow security APIs through virtualized data tables, cursor pagination, composite database indexes, Redis caching, and optimized Entity Framework projections, improving P95 interaction time by **43%**.

- Modernized legacy services from unsupported .NET Core runtimes to **.NET 8** while incrementally migrating Vue 2 modules to the **Vue 3 Composition API**, avoiding a disruptive platform rewrite and preserving customer release schedules.
- Designed secure multi-tenant APIs with **ASP.NET Core**, OAuth 2.0, OpenID Connect, JWT validation, tenant-scoped repositories, and policy-based authorization that prevented cross-customer access to vulnerability and compliance information.
- Eliminated duplicate security findings generated during broker retries by implementing idempotency keys, transactional outbox publishing, **Kafka** consumer checkpoints, and controlled dead-letter replay for recoverable processing failures.
- Built asynchronous ingestion workers with **MassTransit**, Kafka, Azure Service Bus, and batched PostgreSQL persistence, absorbing scanner traffic spikes without exhausting database connections or degrading customer-facing analytics.
- Created a reusable Vue design system with **Storybook**, design tokens, typed component properties, keyboard navigation, and accessibility tests, standardizing complex tables, forms, filters, dialogs, and status indicators.
- Established automated quality gates with **xUnit**, Moq, Testcontainers, Vitest, Vue Test Utils, Playwright, and Pact, detecting API contract mismatches, migration failures, and interface regressions before production deployment.
- Mentored engineers through architecture reviews, pair programming, incident retrospectives, and production-readiness assessments while coordinating technical decisions across security, platform, frontend, backend, product, and quality teams.

Cubic Telecom USA — Software Engineer

Remote/ Full time

January 2019 – April 2021

San Diego, CA

- Developed connected-mobility applications using **.NET Core 2.1–3.1**, **ASP.NET Core**, **Vue 2**, **TypeScript**, PostgreSQL, and RabbitMQ for device registration, SIM provisioning, subscription management, billing, and carrier synchronization.
- Improved provisioning throughput by **38%** through asynchronous command processing, bounded concurrency, batched database operations, and carrier-specific rate limiting that protected external telecom APIs during traffic spikes.
- Resolved failed activations caused by inconsistent carrier identifiers and incompatible response structures by introducing canonical domain models, provider adapters, correlation identifiers, and replayable reconciliation workflows.
- Designed versioned REST APIs with **ASP.NET Core**, Swagger, FluentValidation, standardized error responses, and permission-aware endpoints consumed by Vue customer portals, support tools, and internal operations applications.
- Implemented message-driven provisioning with **MassTransit**, RabbitMQ, durable queues, dead-letter exchanges, bounded retries, and idempotent consumers, preventing duplicate SIM activations while preserving full transaction traceability.
- Reworked slow fleet-management screens using virtualized tables, server-side filtering, normalized **Vuex** state, incremental loading, and request cancellation for customers managing large connected-device inventories.
- Corrected stale connectivity states caused by delayed and out-of-order carrier callbacks through timestamp validation, monotonic state transitions, reconciliation jobs, and real-time Vue updates delivered through **SignalR**.
- Containerized .NET and Vue applications with **Docker** and standardized delivery through **Azure DevOps**, adding automated tests, security scans, migration validation, environment controls, and production approval gates.
- Collaborated with telecom specialists, product managers, designers, support engineers, and frontend developers to convert roaming and provisioning rules into maintainable service boundaries, practical workflows, and incremental releases.

- Built customer and technician applications using **C#**, **.NET Framework 4.6–4.7**, ASP.NET MVC 5, Web API, **Vue 1.x**, later Vue 2, Redis, and SQL Server for claims, payments, eligibility, appointments, and repair tracking.
- Redesigned a fragmented claim journey as a guided Vue workflow backed by recoverable .NET orchestration APIs, increasing successful online claim completion by **27%** through clearer validation and failure recovery.
- Created a backend-for-frontend layer that combined customer, policy, inventory, payment, and appointment information, shielding browser applications from incompatible downstream contracts and partial service failures.
- Corrected duplicate repair bookings caused by repeated submissions and delayed responses through idempotency tokens, SQL Server uniqueness constraints, transactional validation, and visible client-side request states.
- Migrated selected jQuery and server-rendered pages to reusable **Vue components**, introducing shared form controls, centralized state, route-level organization, and consistent browser-side validation behavior.
- Implemented **Redis** caching for frequently requested eligibility and repair-location information, applying explicit invalidation and short expiration periods to improve responsiveness without serving outdated policy decisions.
- Developed scheduled .NET reconciliation services for incomplete claims and delayed payment callbacks, recovering transactions after provider timeouts while preserving audit records for customer-service and finance investigations.
- Expanded automated coverage with **NUnit**, Moq, Vue component tests, Selenium, service virtualization, and API integration suites for claims, payments, appointments, eligibility decisions, and recoverable failure scenarios.

- Maintained learning-platform applications using **C#**, **.NET Framework 4.5**, ASP.NET MVC 5, Web API, MySQL, Backbone.js, and jQuery for course imports, SCORM launches, learner-state persistence, and xAPI processing.
- Implemented REST endpoints and administration workflows for course ingestion and launch configuration, adding validation for malformed archives, incomplete manifests, and nonstandard learning-management-system payloads.
- Resolved excessive memory consumption during large course imports by streaming compressed packages, limiting parallel extraction, disposing temporary resources, and recording actionable processing failures for support teams.
- Built defensive processing for duplicated and out-of-order learner events, preserving accurate completion, score, and resume state across platforms with inconsistent callback and retry behavior.
- Improved database reliability through targeted indexes, transactional updates, parameterized queries, and repeatable migration scripts for learner-state tables used during high-volume launches and reporting periods.
- Evaluated **Vue 1.x** during late 2016 by rebuilding selected administration views as isolated components and documenting state handling, rendering performance, testing requirements, and integration constraints.
- Added automated tests around course imports, launch tokens, xAPI statements, and completion transitions while collaborating with support specialists to reproduce unusual SCORM integration failures.

EDUCATION

Tennessee State University — Bachelor's Degree in Computer Science

Sep 2011 – May 2015

CERTIFICATION

- **Microsoft Certified: Azure Developer Associate**
- **Microsoft Certified: Azure Solutions Architect Expert**
- **AWS Certified Developer – Associate**
- **Professional Scrum Master I — PSM I**
