

Kristine Stanley

Senior Backend Engineer | Node.js, TypeScript & Cloud

Coaldale, CO 81222 | kristine.stanley.dev@outlook.com | +1 (786) 949-7561 | <https://www.linkedin.com/in/kristine-stanley-341688411>

PROFESSIONAL SUMMARY

Senior Backend Engineer with 11+ years delivering cybersecurity, connected-mobility, insurance, and learning-platform systems using **Node.js 8–22**, **TypeScript 3–5**, **NestJS 8–11**, **Express**, **PostgreSQL**, **Redis**, **Kafka**, **AWS**, and **Azure**; specializes in secure API design, event-driven services, legacy modernization, distributed reliability, observability, and technical leadership that improves performance, release confidence, operational resilience, and business scalability.

SKILLS

- **Backend Development:** Node.js 12–22, TypeScript 4–5, JavaScript ES6+, NestJS 8–11, Express 4–5, Fastify, REST APIs, GraphQL, WebSockets, Server-Sent Events, background workers, scheduled jobs
- **API Technologies:** OpenAPI, Swagger, OAuth 2.0, OpenID Connect, JWT, API versioning, API gateways, rate limiting, webhooks, request validation, backend-for-frontend architecture
- **Architecture:** Microservices, modular monoliths, event-driven architecture, domain-driven design, hexagonal architecture, CQRS, transactional outbox, saga workflows, idempotent processing, multi-tenant systems
- **Cloud Platforms:** AWS Lambda, ECS, EKS, API Gateway, S3, RDS, DynamoDB, SQS, SNS, CloudWatch; Azure App Service, Functions, AKS, Service Bus, Key Vault, Application Insights
- **Databases:** PostgreSQL, MySQL, SQL Server, MongoDB, DynamoDB, Redis, database indexing, schema design, query optimization, migrations, connection-pool tuning
- **Messaging and Streaming:** Apache Kafka, RabbitMQ, AWS SQS, Azure Service Bus, dead-letter queues, consumer groups, retry strategies, event replay, message deduplication
- **Testing:** Jest, Supertest, Pact, Testcontainers, Mocha, Chai, Sinon, integration testing, contract testing, end-to-end testing, load testing
- **DevOps:** Docker, Kubernetes, Terraform, Helm, GitHub Actions, Azure DevOps, Jenkins, npm, pnpm, CI/CD pipelines, blue-green deployments, feature flags
- **Monitoring:** OpenTelemetry, Datadog, Prometheus, Grafana, ELK Stack, Sentry, CloudWatch, structured logging, distributed tracing, service-level indicators
- **Engineering Practices:** Technical leadership, architecture reviews, code reviews, mentoring, production support, incident response, root-cause analysis, Agile delivery, secure coding

EXPERIENCE

Veracode Systems Inc — Senior Software Engineer

Remote/ Full time

April 2021 – May 2026

Somerville, MA

- Led backend architecture and delivery for enterprise application-security platforms using **Node.js 14–22**, **TypeScript**, **NestJS**, and **PostgreSQL**, supporting high-volume vulnerability ingestion, policy evaluation, reporting, and remediation workflows.
- Replaced tightly coupled Express services with modular **NestJS** domains, typed contracts, dependency injection, and reusable infrastructure adapters, reducing production defects by **35%** and improving release predictability across multiple engineering teams.
- Resolved API latency spikes caused by repeated aggregate queries and oversized payloads through composite indexing, cursor pagination, Redis caching, response shaping, and query-plan analysis, improving P95 response time by **43%**.
- Modernized legacy services from older Node.js runtimes to **Node.js 20–22**, removing deprecated packages, callback chains, and unsafe shared state while introducing asynchronous workflows, stricter TypeScript settings, and automated compatibility testing.

- Designed secure multi-tenant APIs with **OAuth 2.0**, **OpenID Connect**, JWT validation, role-based authorization, and tenant-scoped data access, preventing cross-customer exposure across administrative, analytics, and remediation services.
- Eliminated duplicate vulnerability events during broker retries by implementing idempotency keys, transactional outbox processing, Kafka consumer checkpoints, and dead-letter recovery with replay controls for failed messages.
- Built asynchronous ingestion pipelines with **Kafka**, **AWS SQS**, background workers, and bulk database writes, handling burst traffic without blocking customer-facing requests or overwhelming downstream scanning and reporting dependencies.
- Introduced contract, integration, and end-to-end testing with **Jest**, **Supertest**, **Pact**, and **Testcontainers**, detecting schema regressions before deployment and reducing dependence on slow shared test environments.
- Implemented distributed tracing and service-level monitoring with **OpenTelemetry**, **Datadog**, structured logs, and actionable alerts, shortening diagnosis of memory leaks, queue backlogs, database contention, and third-party failures.
- Mentored engineers through architecture reviews, incident retrospectives, production-readiness checks, and performance-focused code reviews, strengthening ownership while aligning backend, frontend, security, QA, and product stakeholders.

Cubic Telecom USA — Software Engineer

Remote/ Full time

January 2019 – April 2021

San Diego, CA

- Developed connected-mobility services using **Node.js 8–12**, **TypeScript**, **Express**, and **PostgreSQL**, coordinating device registration, SIM provisioning, subscription changes, usage collection, and carrier-status synchronization.
- Improved provisioning throughput by **38%** through asynchronous command processing, bounded concurrency, batched database operations, and provider-specific rate limiting that protected external carrier APIs during traffic spikes.
- Resolved activation failures caused by inconsistent identifiers and response schemas across telecom partners by introducing canonical domain models, validation adapters, correlation IDs, and replayable reconciliation workflows.
- Designed message-driven provisioning with **RabbitMQ**, durable queues, retry policies, dead-letter exchanges, and idempotent consumers, preventing duplicate activations while retaining full traceability for long-running external transactions.
- Built REST APIs for device, account, billing, and connectivity operations with **OpenAPI** documentation, request validation, versioned contracts, and consistent error envelopes consumed by customer portals and operations tools.
- Optimized slow subscription and usage queries through covering indexes, partition-aware access, connection-pool tuning, and removal of N+1 patterns, stabilizing response times as device and transaction volumes increased.
- Containerized backend services with **Docker** and standardized delivery through **Azure DevOps**, adding automated tests, security checks, environment validation, and controlled deployment promotion across development and production.
- Added structured logging, health checks, service metrics, and alert thresholds through **Application Insights** and **Grafana**, enabling support teams to distinguish provider outages from internal processing failures more quickly.
- Partnered with telecom specialists, product managers, and frontend engineers to convert complex roaming and provisioning rules into maintainable service boundaries, documented API behavior, and incremental release plans.

Asurion — Software Developer

Remote/ Full time

January 2017 – December 2018

Nashville, TN

- Built backend services for device-protection journeys using **Node.js 4–8**, **Express 4**, and **SQL Server**, supporting policy eligibility, claim intake, payment confirmation, repair scheduling, and customer status tracking.
- Raised successful claim completion by **26%** after redesigning orchestration APIs to return clearer validation results, preserve recoverable workflow state, and reduce unnecessary calls to slow policy and inventory systems.
- Created a backend-for-frontend layer that combined customer, policy, inventory, payment, and appointment data, shielding web applications from inconsistent downstream contracts and partial service failures.
- Corrected duplicate repair bookings caused by concurrent submissions through idempotency tokens, database uniqueness constraints, and transactional validation that prevented conflicting appointment reservations.
- Introduced **Redis** caching for frequently requested eligibility and location data, applying explicit invalidation and short-lived fallback rules to improve responsiveness without returning outdated policy decisions.
- Developed scheduled reconciliation jobs for incomplete claims and payment callbacks, recovering records after provider timeouts while preserving audit history for customer service and finance investigations.
- Expanded automated coverage with **Mocha**, **Chai**, **Sinon**, and API integration tests, validating claims, payments, appointments, and recovery paths that had previously depended on manual regression checks.
- Supported production incidents by tracing failed requests across dependent systems, correcting malformed payloads and timeout handling, and documenting root causes that prevented repeated customer-facing disruptions.

Rustici Software — Junior Software Developer

Hybrid/ Full time

June 2015 – December 2016

Nashville, TN

- Maintained learning-technology services using **Node.js 0.10**, **Express 4**, JavaScript, and **MySQL**, supporting SCORM package imports, course launches, learner-state persistence, completion tracking, and xAPI statement processing.
- Implemented REST endpoints and background jobs for course ingestion and launch configuration, adding validation for malformed archives, incomplete manifests, and nonstandard learning-management-system payloads.
- Resolved memory growth in long-running import workers by streaming large archives, releasing temporary objects, and limiting parallel extraction, improving service stability for complex customer course packages.
- Built defensive processing for duplicate and out-of-order learner events, preserving accurate completion, score, and resume state across learning-management systems with inconsistent callback behavior.
- Improved database reliability by adding targeted indexes, transactional updates, and migration scripts for learner-state tables, reducing lock contention during high-volume course launch and reporting periods.
- Added automated tests around course imports, launch tokens, xAPI statements, and completion transitions, preventing regressions across multiple customer integrations and browser-based learning environments.
- Collaborated with senior engineers and support specialists to reproduce customer integration failures, document payload assumptions, and deliver fixes that shortened troubleshooting for unusual SCORM and xAPI implementations.

EDUCATION

Tennessee State University — Bachelor's Degree in Computer Science

Sep 2011 – May 2015

CERTIFICATION

- **AWS Certified Developer – Associate** — Amazon Web Services
- **Microsoft Certified: Azure Developer Associate** — Microsoft
- **Certified Kubernetes Application Developer — CKAD** — The Linux Foundation and Cloud Native Computing Foundation
