

Kristine Stanley

Senior Software Engineer | Vue.js & Node.js, AWS

Coaldale, CO 81222 | kristine.stanley.dev@outlook.com | +1 (786) 949-7561 | <https://www.linkedin.com/in/kristine-stanley-341688411>

PROFESSIONAL SUMMARY

Senior Software Engineer with 11+ years delivering cybersecurity, connected-mobility, insurance, and learning-platform products using **Vue 2–3, Nuxt 2–3, Node.js 12–22, TypeScript, NestJS, PostgreSQL, AWS, and Azure**; combines frontend architecture, secure API development, event-driven systems, legacy modernization, observability, and technical leadership to improve application performance, reliability, release quality, and customer outcomes.

SKILLS

- **Frontend:** Vue.js 2–3, Nuxt.js 2–3, TypeScript, JavaScript ES6+, Composition API, Options API, Pinia, Vuex, Vue Router, VueUse, Vite, Webpack, Vitest
- **UI Engineering:** Vuetify, PrimeVue, Tailwind CSS, Sass, CSS Modules, Storybook, responsive design, reusable component libraries, design systems, WCAG accessibility
- **Backend:** Node.js 12–22, NestJS 8–11, Express 4–5, Fastify, REST APIs, GraphQL, WebSockets, Server-Sent Events, background workers, scheduled jobs
- **API and Security:** OpenAPI, Swagger, OAuth 2.0, OpenID Connect, JWT, RBAC, API versioning, rate limiting, webhooks, request validation, tenant isolation
- **Architecture:** Microservices, modular monoliths, event-driven architecture, domain-driven design, CQRS, transactional outbox, backend-for-frontend, idempotent processing
- **Databases:** PostgreSQL, MySQL, SQL Server, MongoDB, DynamoDB, Redis, schema design, migrations, indexing, query optimization, connection-pool tuning
- **Messaging:** Apache Kafka, RabbitMQ, AWS SQS, Azure Service Bus, consumer groups, dead-letter queues, retries, event replay, message deduplication
- **Testing:** Vitest, Jest, Vue Test Utils, Cypress, Playwright, Supertest, Pact, Testcontainers, Mocha, Chai, unit, integration, contract, and end-to-end testing
- **Cloud and DevOps:** AWS, Azure, Docker, Kubernetes, Terraform, Helm, GitHub Actions, Azure DevOps, Jenkins, Nx, Turborepo, CI/CD, feature flags
- **Monitoring:** OpenTelemetry, Datadog, Prometheus, Grafana, ELK Stack, Sentry, CloudWatch, Application Insights, structured logging, distributed tracing
- **Senior Practices:** Technical leadership, architecture reviews, mentoring, code reviews, production support, incident response, root-cause analysis, Agile delivery

EXPERIENCE

Veracode Systems Inc — Senior Software Engineer

Remote/ Full time

April 2021 – May 2026

Somerville, MA

- Led architecture and delivery for enterprise application-security products using **Vue 2.6**, later **Vue 3, Nuxt, TypeScript, Node.js**, and **NestJS** across vulnerability, policy, reporting, and remediation workflows.
- Modernized tightly coupled Vuex modules into domain-focused **Pinia** stores, composables, and typed service layers, reducing recurring frontend defects by **34%** while simplifying ownership across multiple product teams.
- Resolved browser freezes on vulnerability dashboards by implementing virtualized tables, server-side pagination, memoized computed data, lazy route loading, and Web Worker processing, improving P95 interaction time by **42%**.
- Planned an incremental migration from the **Vue 2 Options API** to the **Vue 3 Composition API**, introducing compatibility builds, reusable composables, and automated regression checks without interrupting customer releases.

- Designed secure backend services with **Node.js**, **NestJS**, **PostgreSQL**, and **Redis**, enforcing tenant isolation, OAuth authentication, role-based authorization, request validation, and auditable administrative operations.
- Eliminated duplicate vulnerability events during broker retries by implementing idempotency keys, transactional outbox processing, **Kafka** consumer safeguards, and controlled dead-letter replay for recoverable failures.
- Created a reusable design system with **Storybook**, Vue components, design tokens, keyboard navigation, and accessibility tests, standardizing tables, filters, forms, dialogs, and notifications across applications.
- Established automated quality gates with **Vitest**, **Vue Test Utils**, **Playwright**, **Supertest**, and contract testing, detecting interface and API regressions before deployment to enterprise environments.
- Implemented observability through **OpenTelemetry**, **Datadog**, structured logs, browser telemetry, and service-level alerts, accelerating diagnosis of API latency, JavaScript failures, queue backlogs, and database contention.
- Mentored engineers through architecture reviews, pair programming, incident retrospectives, and performance-focused code reviews, aligning frontend, backend, security, quality, design, and product stakeholders.

Cubic Telecom USA — Software Engineer

Remote/ Full time

January 2019 – April 2021

San Diego, CA

- Developed connected-mobility portals and supporting services using **Vue 2**, **Vuex**, **TypeScript**, **Node.js 8–12**, **Express**, and **PostgreSQL** for device, subscription, billing, and connectivity operations.
- Reworked slow fleet-management screens with virtual scrolling, server-side filtering, normalized state, request cancellation, and incremental loading, improving responsiveness by **36%** for large connected-device inventories.
- Resolved activation failures caused by inconsistent carrier identifiers and response formats by introducing typed adapters, canonical domain models, correlation identifiers, validation rules, and replayable reconciliation workflows.
- Implemented real-time provisioning updates through **WebSockets**, reconnect strategies, heartbeat monitoring, and explicit fallback states, giving operations teams reliable visibility into long-running carrier transactions.
- Designed Node.js APIs for SIM activation, device registration, billing, and subscription changes with **OpenAPI**, versioned contracts, standardized errors, and permission-aware endpoints consumed by Vue applications.
- Introduced asynchronous processing with **RabbitMQ**, durable queues, dead-letter exchanges, bounded retries, and idempotent consumers, preventing duplicate activations while retaining complete traceability across provider calls.
- Expanded automated coverage with **Jest**, **Vue Test Utils**, **Cypress**, and **Supertest**, reducing production regressions by **29%** across activation, usage, account, and subscription workflows.
- Containerized Vue and Node.js applications with **Docker** and standardized delivery through **Azure DevOps**, adding build validation, security checks, database migrations, and controlled production promotion.
- Partnered with telecom specialists, product managers, designers, and support teams to translate roaming and provisioning rules into maintainable interfaces, service boundaries, documented edge cases, and incremental releases.

- Built customer and technician workflows using **Vue.js**, JavaScript, Vuex-style centralized state, **Node.js 4–8**, **Express**, and **SQL Server** for claims, eligibility, payments, and repair scheduling.
- Redesigned a fragmented multi-page claim process as a guided Vue workflow with inline validation, recoverable state, and clearer error handling, increasing successful online claim completion by **27%**.
- Migrated selected jQuery and server-rendered modules to reusable Vue components, establishing shared form controls, route-level organization, validation behavior, and consistent client-side state management.
- Created Node.js orchestration APIs that combined customer, policy, inventory, payment, and appointment information, shielding browser applications from incompatible downstream contracts and partial service outages.
- Corrected duplicate repair bookings caused by repeated submissions and delayed responses through idempotency tokens, database uniqueness constraints, transactional validation, and visible request-state management.
- Introduced **Redis** caching for frequently requested eligibility and location information, applying explicit invalidation and short-lived fallback rules to improve speed without returning outdated decisions.
- Expanded automated coverage with **Mocha**, **Chai**, **Sinon**, browser tests, and API integration suites for claims, payments, appointments, and recoverable failure scenarios.
- Supported production releases by tracing failed requests across browser and service boundaries, correcting malformed payloads, improving timeout handling, and documenting root causes that prevented repeated disruptions.

- Maintained learning-technology applications using **JavaScript**, **Backbone.js**, jQuery, **Node.js 0.10–4**, **Express 4**, and **MySQL** for course administration, SCORM launches, learner state, and xAPI processing.
- Implemented administration views and REST endpoints for course imports, launch configuration, and completion settings, adding validation for malformed archives, incomplete manifests, and nonstandard platform payloads.
- Resolved memory growth during large course imports by streaming archives, limiting parallel extraction, releasing temporary objects, and displaying accurate progress and actionable failure information.
- Built defensive processing for duplicate and out-of-order learner events, preserving correct completion, score, and resume state across learning-management systems with inconsistent callback behavior.
- Improved maintainability by extracting reusable JavaScript views, data services, and form utilities while adding targeted database indexes and transactional updates for learner-state persistence.
- Added automated JavaScript and API tests around course imports, launch tokens, xAPI statements, and completion transitions, preventing regressions across multiple customer integration patterns.
- Collaborated with senior engineers and support specialists to reproduce unusual SCORM and xAPI failures, document payload assumptions, and deliver fixes that shortened customer troubleshooting cycles.

EDUCATION

Tennessee State University — Bachelor's Degree in Computer Science

Sep 2011 – May 2015

CERTIFICATION

- **AWS Certified Developer – Associate** — Amazon Web Services
- **Microsoft Certified: Azure Developer Associate** — Microsoft
- **Certified Kubernetes Application Developer — CKAD** — The Linux Foundation and Cloud Native Computing Foundation
