

CRISTOFF STAN

Senior Ruby on Rails Engineer – Backend, SaaS, Cloud

Location: Tallinn, Harjumaa, Estonia | Email: cristoffstan@gmail.com
LinkedIn: <https://www.linkedin.com/in/cristoff-s-692816413> | Phone Number: +372 58619311

PROFESSIONAL SUMMARY

Senior Software Engineer with 10+ years delivering **B2B SaaS, e-commerce, fintech, and enterprise workflow platforms** using **Ruby 2.7–3.3, Rails 6–8, PostgreSQL, Redis, Sidekiq, Hotwire, and AWS**; combines scalable API architecture, legacy modernization, background processing, database performance, cloud delivery, and technical leadership to build secure, resilient products that improve reliability, engineering velocity, and business operations.

TECHNICAL SKILLS

- **Ruby and Rails:** Ruby 2.7–3.3, Ruby on Rails 6–8, Active Record, Active Job, Action Cable, Action Mailer, Rails Engines, Rake, Bundler, Puma, Rack, concerns, service objects, form objects, presenters and reusable gems.
- **Backend and API Engineering:** REST APIs, GraphQL, JSON:API, WebSockets, background jobs, scheduled processing, API versioning, pagination, rate limiting, idempotency, webhooks, file processing and third-party service integrations.
- **Frontend and Full-Stack:** Hotwire, Turbo, Stimulus, ViewComponent, ERB, Slim, JavaScript, TypeScript, React, HTML5, CSS3, Tailwind CSS, Bootstrap, responsive design and accessibility.
- **Architecture and Design:** Modular monoliths, microservices, Domain-Driven Design, clean architecture, event-driven architecture, CQRS, transactional outbox, multi-tenancy, saga workflows, repository patterns and dependency injection.
- **Databases and Messaging:** PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch/OpenSearch, Apache Kafka, RabbitMQ, AWS SQS, Active Record migrations, query optimization, indexing, locking, partitioning and connection pooling.
- **Background Processing:** Sidekiq, Sidekiq Pro concepts, Active Job, Redis queues, scheduled jobs, retry policies, unique jobs, dead-letter handling, batch processing, idempotent workers and workload prioritization.
- **Cloud and DevOps:** AWS ECS, EKS, EC2, Lambda, API Gateway, RDS, S3, CloudFront, SQS, SNS, IAM and CloudWatch; Docker, Kubernetes, Terraform, Helm, GitHub Actions, GitLab CI, Jenkins and Argo CD.
- **Testing and Quality:** RSpec, Minitest, FactoryBot, Capybara, VCR, WebMock, Pact, Testcontainers, RuboCop, Brakeman, SimpleCov, mutation-testing concepts, request testing, integration testing and end-to-end testing.
- **Monitoring and Reliability:** OpenTelemetry, Datadog, New Relic, Sentry, Prometheus, Grafana, Elastic Stack, structured logging, distributed tracing, SLI/SLO monitoring, production incident response and root-cause analysis.
- **Security:** OAuth 2.0, OpenID Connect, JWT, Devise, Pundit, CanCanCan, RBAC, tenant-aware authorization, CSRF protection, encrypted credentials, secrets management, audit logging and OWASP practices.
- **Senior Engineering Practices:** Architecture reviews, technical leadership, mentoring, code reviews, legacy modernization, performance engineering, production readiness, release planning, Agile delivery and stakeholder communication.

WORK EXPERIENCE

BEVY

Senior Software Engineer

(September 2021 – June 2026)

Remote, Romania

- Architected multi-tenant SaaS platforms using **Ruby 2.7–3.3, Rails 6–8, PostgreSQL, Redis, Sidekiq, Kafka, and AWS**, establishing reusable service boundaries and production standards across several engineering teams.
- Modernized a tightly coupled Rails monolith into domain-aligned modules and independently deployable services, extracting billing, account, reporting, document, and notification capabilities through staged migration.
- Reduced p95 API latency by **39%** by eliminating Active Record N+1 queries, introducing targeted indexes, replacing unnecessary object hydration with projections, and caching stable reference data in Redis.
- Resolved recurring production incidents caused by Sidekiq retry storms, duplicated jobs, Redis saturation, and missing idempotency controls by introducing unique job keys, bounded retries, queue isolation, and dead-letter workflows.
- Led upgrades from **Rails 6 and Ruby 2.7** to modern Ruby and Rails releases, replacing deprecated gems, resolving Zeitwerk loading issues, tightening keyword-argument compatibility, and validating behavior through staged testing.
- Built secure REST and GraphQL APIs with **OAuth 2.0, OIDC, JWT, Pundit policies, tenant-aware RBAC, audit trails, request throttling, and encrypted credentials** for customer and administrative operations.
- Introduced customer-facing workflow features with **Hotwire, Turbo, Stimulus, ViewComponent, and Action Cable**, reducing frontend complexity while supporting real-time status updates and reusable interface patterns.
- Improved large reporting workloads by adding PostgreSQL materialized views, background exports, batched data processing, streaming downloads, and query timeouts that protected transactional traffic from analytical requests.
- Strengthened CI/CD with **GitHub Actions, Docker, Kubernetes, Terraform, RSpec, RuboCop, Brakeman, and automated migration checks**, improving release safety through canary deployment and rollback validation.
- Mentored engineers through architecture reviews, pull-request feedback, Rails performance debugging, incident retrospectives, and production-readiness sessions that improved ownership and delivery consistency.

Syscom Digital

Software Engineer

(October 2019 – August 2021)

Remote, Romania

- Developed commerce and operations platforms using **Ruby 2.5–2.7, Rails 5.2–6, PostgreSQL, Redis, Sidekiq, and AWS**, supporting checkout, payment, fulfillment, inventory, and customer-service workflows.
- Implemented payment, refund, order-tracking, and webhook features through service objects, typed integration adapters, transactional database updates, and background jobs that isolated unreliable provider behavior.
- Reduced recurring payment and webhook failures by **31%** through idempotency keys, signature validation, correlation IDs, provider-specific error mapping, and controlled replay of failed external events.

- Investigated inventory discrepancies caused by concurrent updates and delayed payment callbacks, then introduced optimistic locking, transactional state transitions, reconciliation jobs, and operational exception reports.
- Resolved slow administration screens by removing N+1 queries, adding eager loading and server-side pagination, simplifying serializers, and indexing frequently filtered order and customer fields.
- Created reusable Rails concerns and middleware for authentication, request tracing, rate limiting, exception handling, webhook verification, and standardized API error responses across business modules.
- Moved email delivery, settlement reconciliation, report generation, and external synchronization into prioritized **Sidekiq queues**, preventing long-running workloads from delaying customer-facing jobs.
- Expanded delivery pipelines with **Jenkins, GitLab CI, Docker, RSpec, RuboCop, Brakeman, database migration checks, and staged deployments** across development, QA, and production environments.
- Collaborated with product owners, QA engineers, support teams, and external vendors to convert unclear commerce requirements into explicit domain rules, API contracts, failure scenarios, and acceptance criteria.

Soft Build

Software Developer

(June 2016 – July 2019)

Remote, Romania

- Built full-stack business applications using **Ruby 2.2–2.6, Rails 4.2–5.2, PostgreSQL, MySQL, Redis, Sidekiq, and JavaScript** for booking, commerce, reporting, and administrative workflows.
- Improved critical page and API response times by **36%** through Active Record query optimization, fragment caching, background processing, asset compression, and removal of unnecessary database round trips.
- Developed REST APIs and server-rendered features for inventory, appointment scheduling, pricing, authentication, reporting, customer profiles, and role-based administrative operations.
- Resolved duplicate submissions, stale inventory values, partial updates, and inconsistent user sessions by adding database transactions, unique constraints, idempotency guards, and explicit recovery workflows.
- Moved email delivery, report generation, CSV imports, image processing, and external synchronization into **Sidekiq and Active Job**, reducing request blocking while providing retries and failed-job visibility.
- Modernized older controllers and models by extracting service objects, query objects, policy classes, and form objects that reduced callback complexity and made high-risk business logic easier to test.
- Added **RSpec, FactoryBot, Capybara, VCR, WebMock, and request tests** around pricing calculations, authentication, persistence rules, integrations, and critical customer workflows.
- Worked with senior engineers on SQL execution plans, database indexing, Linux deployments, Puma tuning, memory diagnostics, code reviews, and production incident resolution.

Decima Digital

Software Developer

(November 2015 – April 2016)

Remote, Estonia

- Delivered customer-facing and administrative functionality using **Ruby 2.1, Rails 4.1, PostgreSQL, MySQL, JavaScript, jQuery, and Linux** for content, account, reporting, and workflow applications.
- Built Rails controllers, models, mailers, service utilities, scheduled Rake tasks, and data-access components for forms, file uploads, notifications, content retrieval, and account management.
- Fixed production defects involving callback loops, missing validations, duplicate records, failed uploads, malformed requests, and unclear user feedback through stronger constraints and exception handling.
- Improved slow database operations by reviewing Active Record queries, adding indexes, reducing unnecessary associations, using bulk updates, and moving expensive reporting work outside request cycles.

- Integrated email, document-storage, mapping, and customer-data providers through reusable adapters that normalized external responses and isolated configuration from business logic.
- Participated in Linux deployment preparation, smoke testing, database backup checks, log analysis, asset compilation, and rollback planning for several client-facing releases.
- Collaborated with designers, project managers, and senior developers to translate business requirements into maintainable Rails modules, practical data models, and realistic implementation estimates.

Borna Technology

Software Developer Intern

(September 2014 – August 2015)

Tallinn, Estonia

- Assisted senior engineers with **Ruby 2.0, Rails 4.0, JavaScript, HTML, CSS, PostgreSQL, MySQL, Git, and Linux** tasks across internal tools and customer-facing web applications.
- Supported development of Rails controllers, Active Record models, form handlers, administration pages, JSON endpoints, database migrations, and server-side validations under experienced guidance.
- Built small interface enhancements, reusable partials, validation utilities, and data-import scripts while learning Rails conventions, MVC architecture, debugging, and disciplined Git practices.
- Investigated invalid submissions, Ruby exceptions, database connectivity errors, broken layouts, and inconsistent JSON responses by reproducing issues and documenting reliable diagnostic steps.
- Contributed to QA checks, deployment notes, RSpec tests, code reviews, and technical documentation, establishing a practical foundation in maintainable Rails delivery and production support.

EDUCATION

Tallinn University

Bachelor's Degree in Computer Science,
September 2011 – May 2014

CERTIFICATIONS

- **AWS Certified Solutions Architect – Associate**
- **AWS Certified Developer – Associate**
- **Certified Kubernetes Application Developer — CKAD**
- **HashiCorp Certified: Terraform Associate**
- **Linux Foundation Certified System Administrator — LFCS**

PROJECTS

High-Throughput Event Processing Platform

- Designed a distributed processing platform using **Rust, Tokio, Axum, Kafka, PostgreSQL, Redis, Kubernetes, and AWS EKS** for payment events, order updates, notifications, and operational reconciliation.
- Implemented partition-aware consumers, idempotency keys, transactional outbox publishing, dead-letter topics, event replay, schema validation, backpressure, and graceful shutdown for predictable processing during traffic spikes.
- Added distributed tracing, consumer-lag dashboards, benchmark suites, load tests, and automated canary deployment checks to validate throughput, latency, and correctness before production promotion.
