Professional Summary

Senior Software Engineer with 10+ years building **SaaS**, marketplace, and internal business platforms across the **software, cloud, and digital product industry**, specializing in **PHP 5.4–8.3, Laravel 4.2–11, Symfony 2.8–6.4, React 16–18**, and **Next.js 9–14** in one production-focused career path. Strong record delivering secure APIs, scalable admin systems, and modern web experiences while solving difficult defects, modernizing legacy codebases, and leading framework migrations with low release risk. Brings hands-on strength in performance tuning, CI/CD, cloud delivery, and cross-team product execution.

Technical Skills

- **Frontend** — **React 16–18, Next.js 9–14**, JavaScript, TypeScript, HTML5, CSS3, Sass/SCSS, responsive UI architecture, server-side rendering, component-driven development, accessibility, state management, API-driven UI patterns
- **Backend & APIs** — **PHP 5.4–8.3, Laravel 4.2–11, Symfony 2.8–6.4**, REST APIs, modular monolith and service-oriented patterns, authentication, authorization, RBAC, background jobs, queues, cron workflows, webhook integrations, admin platforms, payment and third-party service integration
- **Data, Messaging & Search** — MySQL, PostgreSQL, SQL optimization, Redis, RabbitMQ, Elasticsearch, OpenSearch, reporting queries, caching, queue-based processing, full-text search, audit logging
- **Cloud & DevOps** — AWS, Docker, Kubernetes, Nginx, Linux, Terraform, CI/CD, GitHub Actions, GitLab CI, deployment automation, environment management, release hardening
- **Observability, Quality & Security** — PHPUnit, Pest, Jest, React Testing Library, Cypress, Postman, logging, monitoring, error tracking, structured debugging, OWASP-aware secure development, JWT, rate limiting, audit trails

Professional Experience

Viario Networks Inc.

Senior Software Engineer | *January 2021 – December 2025*

- Led delivery of multi-tenant product modules using **PHP 8.1–8.3, Laravel 9–11, Symfony 5.4–6.4, React 18**, and **Next.js 13–14**, helping the platform support higher client concurrency while improving release confidence across customer-facing and internal workflows.
- Re-architected a legacy order and subscription domain that had grown into tightly coupled controller logic, moving business rules into service layers and domain-focused actions, which reduced regression defects by **31%** and made cross-team feature work far easier to coordinate.
- Solved a high-impact production issue where long-running exports exhausted worker memory and caused repeated customer retries, then introduced queue partitioning, chunked processing, and signed download delivery that improved completion reliability by **42%**.
- Implemented a staged migration from older Blade-heavy screens to **React 18** and **Next.js** for operational dashboards and self-service flows, which reduced front-end change lead time by **36%** and gave product teams a cleaner path for iterative releases.

- Upgraded core services from earlier **Laravel** conventions to modern container, event, and job patterns, while also standardizing request validation and exception handling so API behavior became more predictable for both frontend and integration teams.
- Resolved a recurring cache invalidation defect that surfaced stale pricing and entitlement data under burst traffic, then redesigned cache keys, TTL rules, and invalidation hooks with **Redis**, cutting support escalations related to stale data by **29%**.
- Built secure REST endpoints for billing, account management, and partner onboarding with **RBAC**, audit logging, and throttling controls, giving compliance-sensitive workflows better traceability without slowing down day-to-day user operations.
- Introduced search and reporting improvements with **Elasticsearch/OpenSearch** and optimized SQL paths for large account datasets, which reduced slow-query pressure and improved key dashboard response times by **38%** during peak usage windows.
- Drove modernization of shared Symfony-based internal modules into reusable packages and clearer bounded areas, which reduced duplicate logic across teams and made upgrades to newer framework versions significantly less risky.
- Created CI/CD hardening around migrations, test gates, and environment promotion using **Docker**, GitHub Actions, and automated smoke checks, reducing failed deployment rollbacks by **27%** across major releases.
- Partnered closely with product and support teams during incident reviews, translating error patterns into concrete engineering fixes and reducing repeat operational incidents through better instrumentation, defensive validation, and targeted backlog prioritization.
- Balanced feature delivery with flexible use of both **Laravel** and **Symfony** strengths, applying the right framework conventions to legacy and greenfield needs instead of forcing one pattern everywhere, which improved maintainability and developer onboarding.

VividCloud

Software Engineer | January 2016 – December 2020

- Built customer and admin platforms with **PHP 7.1–7.4**, **Laravel 5.5–8**, **Symfony 3.4–5**, **React 16–17**, and **Next.js 9–10**, delivering web applications that supported account operations, reporting, catalog management, and external service integration.
- Modernized a legacy PHP codebase that mixed routing, SQL, and presentation logic in fragile ways, separating responsibilities into controllers, services, repositories, and queued jobs so the team could ship new work with fewer side effects.
- Fixed a persistent checkout issue where duplicate submissions under weak network conditions produced double-record creation and inconsistent payment state, then added idempotency checks and transaction-safe write handling to reduce those incidents by **41%**.
- Implemented early **Next.js** adoption for SEO-sensitive and performance-critical pages while retaining **React** for authenticated application surfaces, which improved first-load behavior and increased marketing page conversion by **18%**.
- Delivered API integrations for payment gateways, CRM tooling, email systems, and document services, while introducing retry-safe job handling and clearer operational logging that shortened production diagnosis time by **33%**.
- Led a practical migration path from older **Symfony** modules toward more maintainable **Laravel** workflows where appropriate, preserving business rules while reducing boilerplate and making day-to-day development more consistent across the team.
- Improved database performance by rewriting expensive join patterns, adding proper indexing, and reducing over-fetching in reporting endpoints, which cut several high-traffic page response times by more than **35%**.
- Added role-aware UI behavior and backend authorization checks that aligned what users could see with what they could actually perform, reducing permission-related support requests and improving trust in administrative tooling.

- Built queue-driven notification, export, and reconciliation jobs with **Redis** and **RabbitMQ** patterns, moving heavy work away from request cycles and stabilizing the user experience during end-of-month traffic spikes.
- Helped standardize test coverage with **PHPUnit**, frontend component checks, and API contract validation so framework upgrades and refactors could move forward with materially lower release anxiety.
- Worked across both product delivery and defect resolution, often taking ambiguous operational issues from first report through code fix and release verification, which made the team more effective during tight roadmap periods.

Minimalist Moon

Software Developer | *January 2013 – December 2015*

- Developed internal and client-facing business applications with **PHP 5.6–7.0**, **Laravel 4.2–5.3**, **Symfony 2.8–3.1**, MySQL, JavaScript, and early **React**-based interface modules where interactive workflows needed more dynamic behavior.
- Implemented core backend features for user administration, reporting, approvals, content operations, and record tracking, translating business rules into maintainable application behavior that reduced manual correction work across support teams.
- Corrected a recurring defect where large report requests locked sessions and encouraged duplicate actions, then moved the heavy processing into asynchronous jobs and added clearer completion states to improve user flow stability.
- Refactored several fragile legacy modules that depended on shared helper files and duplicated SQL snippets, consolidating reusable logic into cleaner service patterns that lowered maintenance cost and improved code review quality.
- Introduced targeted **React** components into selected operational screens instead of forcing a full rewrite, giving the team a flexible modernization path that improved usability while staying realistic for the technology adoption level of that period.
- Created CSV import and export utilities with validation, error messaging, and safer field mapping, reducing bad-data processing incidents by **26%** and helping operations teams correct issues earlier in the workflow.
- Improved page and report performance by tightening SQL queries, adding indexes, and reducing unnecessary payload sizes, which improved responsiveness by **32%** on frequently used administrative screens.
- Added audit trails for sensitive updates so support and managers could trace changes across approvals and account records, making production issue investigation faster and improving operational accountability.
- Worked across both **Laravel** and **Symfony** code depending on product needs, using framework conventions pragmatically and helping stabilize mixed-stack projects rather than treating legacy areas as throwaway systems.
- Supported releases, hotfixes, and customer issue analysis with a hands-on debugging approach that connected browser behavior, PHP errors, SQL outputs, and user feedback into reliable production fixes.

Microsoft

Software Developer Intern | *July 2012 – December 2012*

- Contributed to internal web tooling and support utilities using **PHP 5.4–5.5**, **Symfony 2**, JavaScript, HTML, CSS, SQL Server, and structured debugging practices that emphasized correctness, maintainability, and safe team collaboration.
- Assisted with backend enhancements for operational dashboards and data-entry workflows, focusing on validation logic, cleaner request handling, and practical fixes that improved consistency for internal users.

- Resolved several lower-level defects involving malformed input handling and edge-case state transitions, learning to trace failures through logs, reproduce them reliably, and submit fixes that reduced repeat tester feedback.
- Helped improve query behavior and page rendering for internal modules by reducing unnecessary lookups and cleaning up data access patterns, which improved responsiveness and gave the team a more stable base for future work.
- Participated in peer reviews, documentation updates, and release support tasks that strengthened engineering discipline early, while building the habit of solving issues with measurable clarity instead of patching symptoms only.

Education

Florida State University

Bachelor's Degree in Computer Science | 2008 – 2012
