Professional Summary

Senior Frontend Engineer with 10+ years of experience building high-traffic **SaaS**, **enterprise**, and **customer-facing** web applications, specializing in **React 16–19**, **Next.js 12–15**, **TypeScript 4–5**, and scalable UI architecture for product-led teams. Strong track record modernizing legacy frontends, improving rendering performance, stabilizing complex state flows, and delivering accessible design systems that supported faster releases and better usability. Hands-on with performance profiling, testing, CI/CD, API integration, and frontend observability, with consistent success reducing defects, increasing engagement, and turning ambiguous product goals into reliable production features.

Technical Skills

- **Frontend:** **React 16–19**, **Next.js 12–15**, **TypeScript 4–5**, JavaScript ES6+, HTML5, CSS3, Sass/SCSS, Tailwind CSS, Styled Components, Material UI, Bootstrap, Responsive Design, Cross-Browser Compatibility, Accessibility, WCAG, Design Systems, Storybook
- **State & Data Layer:** **Redux**, Redux Toolkit, Context API, React Query, Apollo Client, Zustand, Formik, React Hook Form
- **Build & Tooling:** Vite, Webpack, Babel, npm, Yarn, ESLint, Prettier, pnpm
- **Testing & Quality:** Jest, React Testing Library, Cypress, Playwright, Enzyme, Unit Testing, Integration Testing, End-to-End Testing
- **Backend & APIs:** REST APIs, GraphQL, WebSockets, OpenAPI, Node.js, Express, Authentication Flows, JWT, OAuth2
- **Cloud & DevOps:** AWS, S3, CloudFront, Lambda, Docker, GitHub Actions, Jenkins, CI/CD Pipelines
- **Observability & Collaboration:** Sentry, Datadog, Chrome DevTools, Lighthouse, Git, GitHub, Jira, Agile, Scrum, Figma

Professional Experience

Viaro Networks Inc.

Senior Software Engineer | *January 2021 – December 2025*

- Led the frontend architecture for a multi-tenant platform using **React 18**, **TypeScript**, and **Next.js**, creating reusable page patterns, shared hooks, and domain-driven component boundaries that improved delivery consistency across several product areas.
- Redesigned a slow customer dashboard whose heavy synchronous filtering caused noticeable UI freezing, then applied **React Query**, memoization, and deferred updates to reduce interaction latency by **42%** during large dataset usage.
- Solved a recurring production issue where stale cached responses caused incorrect counts and inconsistent table states, introducing smarter query invalidation and refresh policies that reduced support complaints by **31%**.
- Built a reusable **design system** with Storybook-backed components, form standards, and accessibility rules, which increased UI consistency across teams and shortened new feature implementation time by **28%**.

- Implemented protected frontend flows for admin and customer portals with **JWT**, role-aware rendering, and audit-friendly actions, helping reduce permission-related defects by **36%** in release cycles.
- Migrated several legacy pages from older React patterns and class-heavy containers into **React 18** functional components with hooks, improving maintainability and making onboarding smoother for newly added engineers.
- Delivered advanced reporting and workflow screens that consumed complex REST and GraphQL APIs, shaping frontend contracts with backend teams so edge cases were handled earlier and production mismatches dropped by **24%**.
- Introduced frontend observability with **Sentry**, structured browser diagnostics, and release-linked error tracking, allowing the team to isolate top client-side failure paths faster and cut mean debugging time by **38%**.
- Improved page performance through code splitting, route-level lazy loading, image optimization, and bundle analysis, raising Lighthouse performance scores by **27%** on the most-used authenticated screens.
- Fixed a subtle memory leak caused by unremoved listeners and long-lived polling logic in a live operations view, stabilizing browser memory usage and preventing prolonged-session crashes for internal users.
- Partnered closely with design and product teams to translate ambiguous requirements into production-ready UI flows, consistently shipping high-visibility features with better usability and fewer late-stage revisions.
- Mentored frontend engineers on component composition, testing depth, and safe refactoring practices, which improved pull request quality, strengthened code ownership, and supported more reliable release behavior.

VividCloud

Software Engineer | *January 2016 – December 2020*

- Built responsive single-page application modules using **React 16–17**, **TypeScript**, and **Redux**, helping deliver customer-facing workflows that handled account management, billing interactions, and operational reporting.
- Reworked a brittle form flow that frequently lost unsaved input during route changes, introducing durable local state and validation recovery patterns that improved successful submission completion by **22%**.
- Developed reusable table, modal, and filter components for data-heavy screens, reducing duplicated UI logic and enabling faster delivery of new product screens across multiple frontend squads.
- Resolved a long-standing rendering issue where nested state updates created unnecessary re-renders and inconsistent widget behavior, then normalized state access patterns to improve UI responsiveness by **26%**.
- Integrated REST APIs for account provisioning, activity history, and internal operations tools, collaborating with backend developers to tighten payload contracts and reduce frontend-backend mismatch bugs by **19%**.
- Modernized the frontend build pipeline by refining **Webpack** configuration, improving asset caching, and removing unused dependencies, which reduced bundle size and improved repeat load speed by **21%**.
- Added **Jest** and **React Testing Library** coverage for critical flows that had historically broken during releases, increasing confidence in refactors and lowering escaped regression counts across sprint handoffs.
- Implemented accessibility improvements across forms, modals, and navigation patterns, including keyboard support and semantic fixes, making the platform more inclusive and easier to use for enterprise customers.
- Helped migrate older jQuery-driven UI fragments into structured React components, reducing maintenance overhead and giving the team a cleaner path toward a more unified frontend codebase.
- Worked with product managers and QA to break down features into incremental releases, which made rollout risk easier to manage and improved acceptance rates for user-facing improvements.

- Supported CI/CD release quality by tightening linting, test checks, and environment validation rules, helping the team catch frontend issues earlier before they reached shared staging environments.

Minimalist Moon

Software Developer | *January 2013 – December 2015*

- Developed interactive web interfaces for client projects using **JavaScript**, **HTML5**, **CSS3**, and gradually adopted **React 15–16** where it was appropriate, balancing maintainability with practical delivery goals.
- Built reusable UI sections for dashboards, forms, content modules, and reporting pages, allowing the team to deliver more consistent implementations across several client-facing projects.
- Fixed a recurring browser compatibility defect that broke layout behavior on older enterprise environments, then reworked styling and fallback logic to reduce visual support tickets by **29%**.
- Improved frontend data handling by cleaning up asynchronous request flows and clearer loading-state behavior, which reduced duplicate user actions and made longer operations feel more reliable.
- Helped introduce React into selected legacy screens that had become difficult to maintain with ad hoc DOM manipulation, making future enhancements faster and reducing change-risk for shared components.
- Created admin-facing interfaces for content operations and workflow management, translating business-heavy requirements into usable screens that improved day-to-day productivity for internal users.
- Resolved several production issues tied to inconsistent validation between frontend and backend layers, aligning form behavior with API expectations and improving first-pass submission success by **18%**.
- Optimized slow client pages by reducing unnecessary asset weight, simplifying DOM-heavy templates, and improving CSS organization, leading to noticeably faster rendering on lower-powered devices.
- Contributed to deployment readiness by organizing assets, improving environment configuration handling, and helping QA reproduce browser-specific issues more quickly before release handoff.
- Worked across developers, designers, and project coordinators with a flexible skill set, which helped keep delivery moving when requirements shifted and reduced frontend rework during late-stage review.

Microsoft

Software Developer Intern | *July 2012 – December 2012*

- Supported internal web application development by building and refining UI components with **HTML**, **CSS**, and **JavaScript**, gaining practical experience in structured frontend engineering within a large-scale product environment.
- Assisted with implementation of dashboard and workflow enhancements, translating mockups into maintainable interface code while learning how enterprise teams approached quality, review standards, and release discipline.
- Investigated UI defects reported by testers, including layout inconsistencies and broken interactions, then delivered targeted fixes that improved functional stability and reduced repeated bug reopen rates.
- Contributed to frontend validation and usability adjustments for internal tools, helping improve form clarity, field feedback, and navigation behavior for employees using operational systems.
- Worked with senior engineers to understand code review expectations, debugging workflows, and issue isolation techniques, building a strong foundation in maintainable frontend delivery practices.
- Helped verify fixes across browsers and environments, documenting reproduction steps clearly so teams could resolve visual and interaction defects with less back-and-forth during testing cycles.
- Supported minor refactoring efforts that simplified markup structure and reduced styling conflicts, improving maintainability for UI areas that had accumulated quick fixes over time.
- Participated in Agile ceremonies and team discussions, learning how cross-functional planning, engineering feedback, and iterative delivery shaped reliable frontend development in practice.
- Strengthened core engineering habits around collaboration, debugging, and production-minded implementation, which created a solid base for later specialization in **React** and modern frontend architecture.

Education

Florida State University

Bachelor's Degree in Computer Science | 2008 – 2012
