Professional Summary

Senior Software Engineer with 10+ years of experience building **Python** and **Vue.js** solutions across **SaaS**, **cloud platforms**, **internal business systems**, and **data-driven web products**, combining backend reliability with responsive frontend delivery using **Python 2.7–3.12**, **Django 1.11–4.x**, **Flask 1.x–3.x**, **FastAPI 0.9x–0.11x**, and **Vue.js 2.x–3.x**. Known for solving production defects, modernizing legacy modules, improving API and UI performance, leading framework upgrades, and shipping secure features that reduced manual effort, improved release quality, and strengthened platform stability in fast-moving engineering environments.

Technical Skills

- **Frontend:** **Vue.js 2.x–3.x**, **JavaScript**, **TypeScript**, **Nuxt.js**, **HTML5**, **CSS3**, **SCSS**, **Vuetify**, **Pinia**, **Vuex**, **Responsive UI**, **Component Design**, **Axios**
- **Backend & APIs:** **Python 2.7–3.12**, **Django 1.11–4.x**, **Flask 1.x–3.x**, **FastAPI 0.9x–0.11x**, **Django REST Framework**, **REST APIs**, **GraphQL basics**, **Celery**, **SQLAlchemy**, **Pydantic**, **JWT**, **OAuth2**, **RBAC**
- **Data, Messaging & Search:** **PostgreSQL**, **MySQL**, **SQL Server**, **Redis**, **MongoDB**, **RabbitMQ**, **Kafka**, **Elasticsearch**, **OpenSearch**, **BigQuery**
- **Cloud & DevOps:** **AWS**, **Azure**, **GCP**, **Docker**, **Kubernetes**, **Helm**, **Terraform**, **GitHub Actions**, **GitLab CI**, **Jenkins**, **Nginx**, **Linux**
- **Observability, Quality & Security:** **OpenTelemetry**, **Prometheus**, **Grafana**, **Datadog**, **Sentry**, **Pytest**, **Unittest**, **Cypress**, **Playwright**, **API contract testing**, **OWASP practices**, **audit logging**, **rate limiting**

Professional Experience

Viaro Networks Inc.

Senior Software Engineer | *January 2021 – December 2025*

- Led development of cloud-hosted product modules using **Python**, **FastAPI**, **Django**, and **Vue.js 3**, delivering backend services and reactive dashboards that improved cross-team workflow speed by **34%** and reduced manual status handling by **27%**.
- Designed and maintained secure **REST APIs** with **JWT**, **RBAC**, and audit logging, giving operations and admin users clearer control boundaries while improving internal compliance tracking by **31%**.
- Implemented a major frontend modernization from aging Vue 2 patterns to **Vue.js 3** with **Composition API** and better state management, reducing UI regression volume by **29%** and making feature delivery more predictable.
- Resolved a recurring production issue where large filtered reports caused API timeout spikes and frozen screens, then split heavy queries into background jobs with progress polling and lowered support complaints by **38%**.
- Refactored backend validation flows in **FastAPI** and **Pydantic** so malformed payloads returned actionable responses instead of generic server failures, which improved integration success rates by **24%**.

- Built asynchronous processing pipelines with **Celery**, **Redis**, and event-driven patterns to handle notifications, exports, and scheduled sync jobs without blocking core request paths during peak traffic periods.
- Introduced structured logging, tracing, and dashboard monitoring through **OpenTelemetry**, **Prometheus**, and **Grafana**, which cut mean time to isolate production faults by **41%** during incident reviews.
- Improved PostgreSQL query performance by revisiting indexes, pagination strategy, and ORM access patterns, reducing latency on high-traffic endpoints by **36%** and stabilizing response times during traffic bursts.
- Worked through a legacy authentication bug that intermittently invalidated active sessions after token refresh, then corrected token rotation logic and eliminated a frequent source of user-facing interruption.
- Supported containerized deployment workflows with **Docker**, **Kubernetes**, and CI automation, helping the team reduce release friction by **22%** and move to more repeatable rollout practices across environments.
- Partnered with product and QA teams to implement new customer-facing workflow features in a flexible delivery model, balancing rapid iteration with safe rollout controls, regression checks, and rollback readiness.
- Mentored engineers on Python service boundaries, API design, and Vue component structure, raising code consistency and review quality while helping the team ship larger features with less rework.

VividCloud

Software Engineer | January 2016 – December 2020

- Built multi-module web applications using **Python**, **Django**, **Flask**, and **Vue.js 2**, supporting SaaS and internal operational systems where backend accuracy and maintainable UI behavior were equally important.
- Implemented reusable API and frontend patterns for user management, approvals, document handling, and reporting, which improved delivery consistency and reduced duplicate implementation effort by **26%**.
- Solved a persistent issue where long-running imports locked request workers and created duplicate submissions, then moved processing into queued jobs with clearer status feedback and reduced retry noise by **33%**.
- Created data import and export routines with validation, mapping rules, and row-level error reporting, helping operations teams improve first-pass data acceptance by **28%** on high-volume business workflows.
- Extended **Vue.js 2** interfaces with modular components and shared service patterns, which improved maintainability across admin screens and reduced UI defect recurrence by **21%** after new releases.
- Improved legacy Django ORM queries and raw SQL paths that had become slow as datasets grew, cutting page and endpoint response times by **32%** on several heavily used screens.
- Delivered new platform features for dashboard filtering, activity history, and notification workflows while maintaining compatibility with older modules that still relied on established server-rendered patterns.
- Handled framework and library upgrade work across **Python 3.x**, Django packages, and frontend build tooling, reducing dependency risk and smoothing the path for more modern development practices.
- Added role-aware access rules and audit history for sensitive record edits so support teams could trace operational changes faster and reduce escalation turnaround time by **25%**.
- Collaborated closely with QA and stakeholders to reproduce edge-case bugs in approval flows, then fixed state mismatch issues between backend responses and Vue components that had caused inconsistent screen behavior.
- Contributed to CI and deployment improvements with test automation and packaging discipline, helping the team reduce failed release incidents and strengthen confidence in iterative delivery.

Minimalist Moon

Software Developer | *January 2013 – December 2015*

- Developed business web applications using **Python 2.7–3.x**, **Django**, server-rendered templates, and targeted **Vue.js 2** enhancements, delivering practical internal systems with reliable CRUD and reporting workflows.
- Implemented backend logic for approvals, role-based access, notifications, and operational tracking, translating business rules into stable application behavior that improved day-to-day processing quality by **23%**.
- Introduced **Vue.js 2** on selected high-interaction screens to modernize user experience without forcing a risky full rewrite, giving the team a flexible migration path toward component-based development.
- Corrected a repeated issue where report generation exhausted request time and confused users into resubmitting forms, then shifted workload into background routines and improved status communication.
- Built CSV import tools with detailed validation and error messaging, which reduced bad data entry by **24%** and gave support staff much faster visibility into failed records.
- Improved list and search performance through better indexing, narrower query selection, and pagination changes, lowering page latency by **30%** on several operational dashboards.
- Added change-history visibility for sensitive record edits so teams could investigate mistakes and support questions more effectively without relying on direct database inspection.
- Maintained compatibility across older Python modules while gradually improving code organization, which helped stabilize legacy workflows and made future enhancement work less risky.
- Worked across backend and UI layers to deliver new features for reporting, task routing, and account administration, showing flexible use of skills in a period with mixed technology patterns.
- Supported testing, deployment packaging, and production troubleshooting with a hands-on mindset, improving release reliability and reducing avoidable post-release cleanup work by **19%**.

Microsoft

Software Developer Intern | *July 2012 – December 2012*

- Supported engineering work on internal productivity and web-based workflow tools using **Python**, JavaScript, SQL-backed services, and maintainable UI enhancements appropriate to enterprise development practices of that period.
- Assisted with bug fixing, form behavior improvements, and service integration tasks, helping resolve user-facing inconsistencies and improving functional stability across shared internal modules.
- Investigated a defect where inconsistent validation between frontend input handling and backend processing caused rejected submissions, then aligned rules and reduced avoidable form failures for end users.
- Contributed to small feature delivery across data entry, search, and reporting flows while learning structured review practices, team collaboration, and disciplined release habits in a large engineering environment.
- Improved query handling and response formatting in selected internal endpoints so data-heavy pages loaded more predictably and generated fewer support questions from business users.
- Helped document issue reproduction steps, test outcomes, and implementation notes, making handoff smoother for full-time engineers and improving clarity during bug triage discussions.
- Worked within established coding standards and source control workflows to ship safe incremental changes, building strong habits around maintainability, peer feedback, and reliable delivery.
- Participated in debugging sessions involving cross-layer issues between backend responses and UI rendering, gaining practical experience in tracing failures through logs, request flow, and data state.
- Adapted quickly across backend, database, and frontend tasks, showing early flexibility with engineering fundamentals while contributing meaningfully to production-adjacent enterprise software work.

Education

Florida State University

Bachelor's Degree in Computer Science | 2008 – 2012
