PROFESSIONAL SUMMARY

Experienced Senior .NET Engineer with over 8 years in backend and full-stack development, specializing in building scalable and secure trading systems, real-time financial APIs, and cloud-native microservices. Seeking to contribute my fintech experience and system architecture skills to DIGIPAL's next-gen trading platform.

TECHNICAL SKILLS

- **Languages & Frameworks:** C#, .NET 6/7, ASP.NET Core, Web API, REST, JavaScript, TypeScript, React, Angular
- **Architecture:** Microservices, CQRS, Event-Driven Architecture, Domain-Driven Design
- **DevOps & Cloud:** Azure (App Services, Service Bus, Key Vault, Blob Storage), Docker, Kubernetes, GitHub Actions
- **Data & Storage:** SQL Server, PostgreSQL, Redis, Entity Framework Core
- **Tools:** Git, Azure DevOps, Jira, Confluence, Swagger, Postman, NUnit, xUnit
- **Other:** Real-time systems, Financial data integration, FIX protocol (familiar), Trading APIs (Binance, Coinbase), TDD

WORK EXPERIENCE

Senior Software Engineer

Sensidev

September 2021 – December 2024

Timișoara, Romania (Remote)

- Led development of microservices for a decentralized trading analytics platform, integrating financial market data feeds and building latency-optimized backend APIs using .NET 6
- Designed and implemented secure WebSocket-based streaming services for real-time price updates and trade event notifications using SignalR and Azure Service Bus
- Architected a high-throughput trade reconciliation service leveraging parallel task execution and SQL Server partitioning, improving processing speed by 300%
- Collaborated on exchange gateway services interfacing with Binance, Coinbase, and Kraken APIs, focusing on rate-limiting, fault tolerance, and trade execution integrity
- Developed modular authentication and authorization layers using Azure Active Directory and JWT, compliant with financial regulatory standards
- Managed CI/CD pipelines in GitHub Actions with Docker container builds and Azure deployment stages, improving release automation and rollback strategies

- Implemented telemetry and performance tracing using Azure Application Insights for key APIs, proactively identifying bottlenecks in high-load conditions
- Contributed to cross-functional sprint planning and architecture reviews with frontend and QA teams, ensuring delivery of robust and testable product increments

Software Engineer

Syscom Digital

October 2019 – August 2021

Bucharest, Romania (Remote)

- Engineered fintech microservices handling secure transactions and digital wallet operations using .NET Core and SQL Server for enterprise-level banking software
- Created real-time fraud detection modules utilizing event sourcing and anomaly pattern tracking across transaction streams processed through distributed queues
- Developed RESTful APIs for account management and transaction history that served over 100K daily users with less than 120ms average response time
- Led migration of legacy .NET Framework modules to .NET Core 3.1 while redesigning code to support async pipelines and CQRS principles
- Integrated AML/KYC identity verification providers using secure OAuth2 flows and webhooks for onboarding automation
- Implemented end-to-end test suites with NUnit, Postman, and custom mocks to ensure deterministic outputs for every service interaction
- Contributed to Dockerization of all service layers and managed service orchestration using Docker Compose for dev environments
- Collaborated with UI developers to expose real-time market analytics dashboards using SignalR and WebSocket-based channels

Software Developer

Soft Build

June 2016 – July 2019

Timișoara, Romania (Remote)

- Designed and developed back-office trading support tools for portfolio managers, including fund allocation modules, net asset valuation tools, and asset status trackers
- Built secure RESTful APIs to integrate with brokerage platforms and market data providers, conforming to OpenAPI standards
- Refactored existing monolithic financial tools into distributed .NET Core services connected via RabbitMQ for better scalability and fault isolation
- Developed internal dashboards using Angular for visualizing fund performance metrics and reconciliation issues
- Created custom Entity Framework migration logic for high-frequency transaction data archiving and indexing
- Introduced caching layer using Redis to handle market lookup endpoints, cutting DB load by over 60%
- Worked on OAuth2 identity layer with role-based authorization for sensitive operations such as portfolio rebalancing and payout scheduling
- Integrated logging and alerting with Serilog and ELK stack to improve system observability

Software Developer
Decima Digital
November 2015 – April 2016
Tallinn, Estonia

- Assisted in developing modules for digital securities issuance, including smart contract lifecycle management and investor registration workflows
- Created admin panel for monitoring digital asset issuance processes using Angular and RESTful APIs built in ASP.NET
- Automated compliance verification steps using rule-based checks before token release operations
- Participated in a blockchain-based prototype for recording securities ownership events using testnet deployments and off-chain indexing
- Implemented modular PDF reporting services for security token cap tables and investor distributions
- Integrated with early-stage Ethereum SDKs to explore programmable securities models
- Enhanced multi-tenant architecture for regulated asset deployments
- Supported DevOps setup with Docker and Azure DevTest Labs for safe experimentation

Software Developer Intern
Borna Technology
September 2014 – August 2015
Tallinn, Estonia (On-Site)

- Supported internal tools for tracking digital asset exchanges and performing periodic ledger syncing with financial APIs
- Implemented backend validation logic for crypto payment flows across ETH and BTC, utilizing hash confirmations and time lock checks
- Created tools to reconcile internal balances with public blockchain explorers
- Built proof-of-concept dashboards to visualize token activity and asset distribution using Chart.js
- Developed test harnesses in C# to simulate edge cases in asset transfer logic
- Assisted in REST API design documentation and Postman collection management
- Worked on integrating hardware wallet signing logic for secure withdrawals
- Collaborated with product manager to refine use cases for crypto payout workflows

EDUCATION

Tallinn University

Bachelor's Degree in Computer Science,
2010 – 2014

CERTIFICATIONS

- ❖ Microsoft Certified: Azure Developer Associate
 - ❖ Microsoft Certified: DevOps Engineer Expert
 - ❖ Docker & Kubernetes for .NET Developers – Udemy
 - ❖ Financial Markets – Yale (Coursera)
 - ❖ Algorithmic Trading with C# and .NET Core – Udemy
-

PROJECTS

Multi-Exchange Trade Orchestrator

- Developed a modular orchestrator to manage trades across Binance, Coinbase, and Kraken with pluggable API adapters, error handling, and execution fallbacks.
- Features included market order simulation, slippage tracking, and real-time trade logging using Azure Blob Storage and Event Grid.

Tokenized Securities Platform Prototype

- Built backend for issuing and tracking tokenized securities using a .NET microservice stack, Azure Blob Storage, and experimental Ethereum-based smart contract interactions.

Real-Time Asset Insights Dashboard

- Created a dashboard to display real-time metrics of crypto holdings, open orders, and PnL using SignalR, Redis pub/sub, and Angular.
