

CRISTOFF STAN

Senior Software Developer

Location: Tallinn, Harjumaa, Estonia | Email: cristoffstan@gmail.com
LinkedIn: <https://www.linkedin.com/in/cristoff-stan-b53490362/> | Phone Number: +372 58619311

PROFESSIONAL SUMMARY

Innovative and performance-driven Senior Software Engineer with 9+ years of experience building scalable backend services, distributed cloud-native platforms, and AI-integrated applications. Specializes in Go, Python, and Node.js, with a strong foundation in microservice architecture, LLM orchestration, and secure data pipelines. Adept at designing high-performance systems in cloud and remote environments, collaborating across product, data science, and engineering teams to deliver intelligent and resilient AI-powered platforms.

TECHNICAL SKILLS

- **Languages:** Go, Python, TypeScript, JavaScript, C#, Java, SQL, Shell
- **Cloud & DevOps:** AWS (S3, RDS, Bedrock, SageMaker, Lambda), Docker, Kubernetes, Terraform, GitHub Actions, CI/CD
- **Frameworks & Tools:** FastAPI, Node.js, Express.js, React, Vue.js, Flask, Gin, gRPC, Prometheus, Grafana
- **AI/ML & LLMs:** LangChain, OpenAI, Pinecone, Vector Databases, Retrieval-Augmented Generation, Autonomous Agents, HuggingFace Transformers
- **Databases:** PostgreSQL, MongoDB, Redis, DynamoDB, Elasticsearch
- **Architecture:** Microservices, REST APIs, Event-Driven Design, Message Queues, Kafka, RabbitMQ
- **Security:** OAuth2, JWT, SSL, VPC, IAM, Secrets Manager, compliance-aware backend design

WORK EXPERIENCE

Sensidev

Senior Software Engineer

September 2021 – December 2024

Timișoara, Romania

- Architected and developed a cloud-native Go-based backend platform integrating LangChain and OpenAI to support enterprise LLM-powered document search and summarization pipelines
- Designed autonomous agent workflows that intelligently orchestrated task sequences using vector embeddings and prompt injection safeguards within secure VPC environments
- Created secure retrieval-augmented generation (RAG) APIs with vector database integration (Pinecone) to serve intelligent recommendations and structured answers from unstructured data
- Built high-throughput ingestion services and RESTful APIs connected to S3 and RDS, enabling scalable ingestion of documents and metadata for AI-driven workflows

- Integrated real-time event processing using Kafka and Redis Streams to support asynchronous execution of AI pipelines with visibility and retry mechanisms
- Led weekly planning sessions and technical spikes, delivering platform components used across multiple AI-enabled micro-frontends and internal automation tools
- Implemented CI/CD pipelines via GitHub Actions and managed EKS Kubernetes deployments with rolling updates, health checks, and auto-scaling triggers
- Mentored junior engineers on backend design patterns, Go concurrency, and API security best practices in a fast-paced Agile environment

Syscom Digital

Software Engineer

October 2019 – August 2021

Bucharest, Romania

- Engineered multiple backend services in Node.js and Python to power campaign analytics, message queues, and automated AI decisioning flows for digital marketing platforms
- Developed integrations with enterprise CRMs and marketing tools using REST and GraphQL APIs, establishing data bridges across multiple distributed systems
- Utilized AWS Lambda, DynamoDB, and S3 for event-driven serverless pipelines, optimizing for cost and performance in dynamic workloads
- Designed and implemented custom middleware for logging, metrics, and user authentication using JWT and OAuth2 within Kubernetes microservice environments
- Built end-to-end dashboards using React and REST APIs to visualize AI campaign insights and anomaly detection feedback loops
- Contributed to internal NLP tooling prototypes for sentiment analysis using spaCy and fine-tuned transformer models via HuggingFace
- Monitored and improved system observability using Prometheus and Grafana, resolving performance bottlenecks through intelligent caching and pagination logic
- Created test plans, integration pipelines, and error reporting tools to ensure platform quality, reducing incident frequency by over 40%

Soft Build

Software Developer

June 2016 – July 2019

Timișoara, Romania

- Built a suite of modular backend services using Express.js and TypeScript to handle content delivery, subscription systems, and analytics tracking
- Collaborated with cross-functional teams to deploy cloud-native microservices to AWS, using ECS and Terraform for scalable infrastructure provisioning
- Developed secure APIs and integrated logging and alerting frameworks to support a growing user base across web and mobile platforms
- Implemented multithreaded data scrapers with Python and Selenium for competitive intelligence, enabling real-time data indexing and automated content ingestion
- Integrated data processing pipelines using pandas and PostgreSQL for statistical report generation and data-driven UI widgets
- Introduced test automation frameworks using Jest and Mocha, increasing code coverage and reducing manual QA workloads
- Optimized backend response times with Redis caching and tuned queries for high-performance PostgreSQL indexes
- Supported internal DevOps migration to containerized environments and CI/CD automation for staging and production parity

Decima Digital
Software Developer
November 2015 – April 2016
Tallinn, Estonia

- Developed middleware services for B2B logistics APIs in Python and Flask, integrating ERP systems with real-time order tracking platforms
- Built and tested integrations with legacy FTP/XML pipelines, migrating them to RESTful interfaces with robust validation and error handling
- Refactored existing authentication modules to comply with OAuth2 and GDPR data flow practices
- Implemented unit testing and logging layers to improve code traceability and debugging for cross-region logistics services
- Worked closely with project leads and clients to design system workflows and ensure API contracts met real-world shipping SLA scenarios
- Participated in architecture discussions to improve system scalability and uptime with failover strategies
- Used Docker to create containerized development environments that replicated production behavior
- Managed Jira tickets and sprint updates, consistently delivering critical components ahead of release schedules

Borna Technology
Software Developer Intern
September 2014 – August 2015
Tallinn, Estonia

- Contributed to backend modules written in Python and JavaScript, supporting web-based learning platforms for education partners
- Designed microservices that supported multilingual content delivery and live content updates
- Developed data normalization scripts for MongoDB and SQLite to clean and standardize thousands of legacy records
- Collaborated on RESTful API development for frontend integration, with Swagger documentation and security middleware
- Learned and applied version control and team workflows via GitLab, code reviews, and pair programming
- Participated in usability testing of internal dashboards, incorporating feedback into backend changes
- Assisted with testing and quality assurance using Postman, Selenium, and unit test frameworks
- Shadowed senior engineers and gained hands-on experience with system design, logging, and basic deployment pipelines

EDUCATION

Tallinn University

Bachelor's Degree in Computer Science,
2010 – 2014

CERTIFICATIONS

- ❖ AWS Certified Solutions Architect – Associate
- ❖ Generative AI with Large Language Models – Coursera (AWS & DeepLearning.AI)

- ❖ Kubernetes for Developers – Udacity
 - ❖ Go for Cloud-Native Applications – Pluralsight
-

PROJECTS

✓ **GenAI-RAG-Platform (2024)**

- Designed and implemented a cloud-native retrieval-augmented generation platform using Go, LangChain, Pinecone, and OpenAI APIs
- Engineered secure document ingestion pipelines, embedding generation, and vector store indexing with multi-tenant support
- Integrated enterprise identity systems and dashboards to support real-time insights for internal users across multiple departments

✓ **Agentic AI Workflow Framework (2023)**

- Created a modular Go-based framework for building autonomous agents capable of dynamic task execution based on semantic memory, tools, and planning logic
- Used prompt chaining, vector memory, and tools integration to enable multi-turn autonomous workflows with full logging and reasoning graphs
