US citizen | White | English (Native)

PROFESSIONAL SUMMARY

Senior Software Engineer with 11+ years delivering enterprise-grade solutions in **fintech, SaaS, and enterprise workflow systems**, specializing in **.NET Core (3.1–8), Angular (10–18), and cloud-native architectures on Azure and AWS**, with strong expertise in modernizing legacy monoliths into **scalable microservices**, resolving complex production issues, and improving performance by over **35%** through optimized APIs, caching, and database tuning, while implementing secure **JWT/OAuth2 authentication**, CI/CD pipelines, and observability to ensure highly reliable, maintainable, and production-ready systems.

SKILLS

- **Frontend:** Angular (10–18), AngularJS, TypeScript, RxJS, NgRx, Angular Material, HTML5, CSS3, SCSS, Responsive UI, Reactive Forms, State Management
- **Backend & APIs:** C#, .NET Framework, .NET Core (3.1–8), ASP.NET Core Web API, REST APIs, Microservices, Entity Framework Core, Dapper, LINQ, WebSockets
- **Data, Messaging & Search:** SQL Server, PostgreSQL, MySQL, Redis, MongoDB, Kafka, RabbitMQ, Elasticsearch
- **Cloud & DevOps:** AWS (EC2, S3, RDS, Lambda), Azure (App Services, Functions, Storage), Docker, Kubernetes, CI/CD (Azure DevOps, GitHub Actions), Nginx
- **Observability, Quality & Security:** OpenTelemetry, Application Insights, Prometheus, Grafana, ELK Stack, JWT, OAuth2, RBAC, Unit Testing, Integration Testing

EXPERIENCE

Senior Software Engineer

SumatoSoft | January 2021 - December 2025

- Designed and implemented scalable **microservices architecture using .NET Core 6–8 and Angular 13–18**, enabling modular deployment and improving system reliability by over **28%** through decoupled service boundaries and API gateway routing strategies.
- Migrated a legacy **.NET Framework monolith to .NET Core**, resolving dependency conflicts, optimizing middleware pipelines, and ensuring zero-downtime deployment through blue-green release strategies and staged rollout validation.
- Engineered high-performance **REST APIs with ASP.NET Core**, reducing response latency by **35%** by introducing Redis caching layers, query optimization, and asynchronous processing patterns.
- Developed advanced **Angular reactive forms and NgRx-based state management**, resolving inconsistent UI state bugs and improving user interaction stability across large-scale enterprise dashboards.
- Identified and fixed critical **memory leak issues caused by unmanaged event subscriptions and cache misuse**, validated through heap profiling and long-running load tests in production-like environments.
- Implemented real-time communication features using **SignalR**, enabling live updates across dashboards while handling connection retries and ensuring data consistency under high concurrency.
- Optimized SQL Server queries using indexing and execution plan analysis, significantly reducing query execution time and improving reporting module performance under heavy workloads.
- Built secure authentication systems using **OAuth2 and JWT-based RBAC**, addressing privilege escalation bugs and improving audit traceability across multi-tenant environments.
- Enhanced CI/CD pipelines with **GitHub Actions and Docker**, resolving flaky build failures by pinning dependencies and separating unit, integration, and e2e test workflows.
- Introduced centralized logging and observability using **OpenTelemetry and Grafana**, reducing incident resolution time by over **30%** through actionable metrics and tracing insights.

- Implemented feature flag systems to support safe rollout of new features, minimizing production risk and enabling quick rollback during unexpected failures.
- Collaborated cross-functionally to deliver complex enterprise workflows, ensuring alignment between backend services and Angular frontend modules for seamless integration.

Senior Software Engineer

High Touch Technologies | June 2018 - December 2020

- Developed enterprise-grade applications using **.NET Core and Angular 9–12**, focusing on modular architecture and scalable service design for business-critical systems.
- Refactored legacy AngularJS modules into modern Angular architecture, improving maintainability and resolving performance bottlenecks caused by inefficient digest cycles.
- Implemented robust **Reactive Forms validation systems**, reducing form submission errors and improving user experience consistency across complex business workflows.
- Solved concurrency issues related to duplicate transactions by introducing idempotency keys and database-level constraints, ensuring data integrity across distributed services.
- Built RESTful APIs with proper versioning and backward compatibility strategies, enabling smooth client migration without service disruption.
- Integrated messaging systems using **RabbitMQ and AWS SQS**, improving asynchronous processing reliability and reducing system coupling.
- Enhanced application performance by optimizing API calls and implementing caching strategies, achieving measurable improvements in response time and system throughput.
- Strengthened application security by implementing **JWT authentication and role-based authorization**, resolving unauthorized access vulnerabilities.
- Improved CI/CD workflows using Docker-based pipelines, ensuring consistent builds across environments and reducing deployment errors.
- Diagnosed and resolved intermittent production issues using structured logging and monitoring tools, improving system uptime and reliability.
- Collaborated with frontend teams to align Angular components with backend APIs, ensuring consistent data contracts and efficient communication patterns.

Software Engineer

Centric Tech Inc. | September 2015 - May 2018

- Developed business applications using **.NET Framework 4.5–4.7 and early Angular adoption**, supporting enterprise workflows and internal management systems.
- Built CRUD-heavy modules and reporting features using SQL Server, gaining strong experience in relational data modeling and query optimization techniques.
- Enhanced legacy systems by introducing modular frontend components, improving user interaction without requiring full system rewrites.
- Resolved critical data consistency issues by implementing validation logic and improving transaction handling across backend services.
- Improved batch processing systems for imports and exports, reducing failure rates and providing clearer error diagnostics for operational teams.
- Optimized database performance through indexing strategies and query refactoring, significantly improving page load times and backend efficiency.
- Implemented authentication mechanisms and access control features, ensuring secure handling of sensitive business data.
- Worked closely with QA teams to identify and fix bugs in production workflows, improving system stability and user trust.
- Maintained deployment pipelines and supported production releases, ensuring smooth delivery of features and fixes.
- Collaborated with cross-functional teams to deliver end-to-end features, aligning backend logic with frontend presentation layers.

Software Engineer Intern

Microsoft | September 2014 - August 2015

- Contributed to internal tools using **C# and .NET**, supporting development teams with automation and workflow improvements.
- Assisted in building web interfaces and backend services, gaining exposure to enterprise-level coding standards and architectural practices.
- Debugged and resolved issues in existing systems, improving code quality and reducing defects in production environments.
- Participated in code reviews and testing processes, ensuring adherence to best practices and improving overall software reliability.
- Supported integration efforts between frontend and backend systems, ensuring seamless communication and data consistency.
- Enhanced development workflows by contributing to automation scripts and build processes, improving team productivity.
- Worked in a collaborative team environment, learning industry-standard development methodologies and tools.
- Gained hands-on experience with version control systems and CI pipelines, supporting continuous integration efforts.
- Contributed to documentation and knowledge sharing, helping improve onboarding processes for new developers.

EDUCATION

Harvard University

Bachelor's degree in Computer Science

2010 - 2014

- Focused on strong foundations in **software engineering, systems design, and data structures**, with project work emphasizing practical, production-oriented problem solving.
