

Kristine Stanley

Staff / Senior Go Software Engineer

Coaldale, CO 81222 | kristine.stanley.dev@outlook.com | +1 (786) 949-7561 | <https://www.linkedin.com/in/kristine-stanley-341688411>

PROFESSIONAL SUMMARY

Staff/Senior Go Software Engineer with 11+ years delivering cloud-native platforms across application security, connected mobility, device protection, and SaaS using **Go 1.2–1.24**, **Kubernetes**, **Kafka**, **PostgreSQL**, **Redis**, and **AWS**, providing architecture leadership, high-throughput API design, distributed-systems reliability, production modernization, and measurable performance gains while mentoring teams and translating complex business needs into secure, scalable products.

SKILLS

- **Languages:** Go/Golang 1.2–1.24, SQL, Bash, Python, TypeScript, Java
- **Go Development:** Goroutines, channels, concurrency patterns, worker pools, context propagation, interfaces, generics, reflection, profiling, memory management, dependency injection, table-driven testing
- **Backend and APIs:** REST, gRPC, Protocol Buffers, GraphQL, WebSockets, OpenAPI/Swagger, Gin, Echo, Chi, Gorilla Mux, API versioning, webhooks, middleware
- **Architecture:** Microservices, distributed systems, event-driven architecture, domain-driven design, clean architecture, hexagonal architecture, CQRS, service-oriented architecture, multi-tenant SaaS
- **Messaging and Streaming:** Apache Kafka, Kafka consumer groups, RabbitMQ, AWS SQS, AWS SNS, dead-letter queues, event replay, schema evolution, idempotent consumers
- **Cloud Platforms:** AWS EKS, ECS, EC2, Lambda, API Gateway, S3, RDS, DynamoDB, ElastiCache, IAM, CloudWatch, Azure Kubernetes Service
- **DevOps and Infrastructure:** Docker, Kubernetes, Helm, Terraform, Argo CD, GitHub Actions, GitLab CI/CD, Jenkins, Linux, Nginx, blue-green deployments, canary releases
- **Databases and Caching:** PostgreSQL, MySQL, SQL Server, Cassandra, DynamoDB, Redis, Elasticsearch, query optimization, indexing, transactions, data modeling
- **Testing:** Go testing package, Testify, GoMock, integration testing, contract testing, end-to-end testing, k6, JMeter, race detection, fuzz testing
- **Monitoring and Reliability:** OpenTelemetry, Prometheus, Grafana, CloudWatch, ELK Stack, distributed tracing, structured logging, SLI/SLO management, incident response
- **Security:** OAuth 2.0, OpenID Connect, JWT, RBAC, TLS, secrets management, OWASP practices, SAST, DAST, dependency scanning, secure API design
- **Leadership Practices:** Architecture reviews, technical roadmaps, ADRs, code reviews, Agile delivery, production troubleshooting, mentoring, cross-functional collaboration

EXPERIENCE

Veracode Systems Inc — Senior Software Engineer

Remote/ Full time

April 2021 – May 2026

Somerville, MA

- Architected and delivered **Go 1.14–1.24** services for an application-security platform, replacing tightly coupled legacy components with independently deployable **microservices** and stable service contracts.
- Designed high-throughput **REST and gRPC APIs** for scan orchestration, policy evaluation, findings enrichment, and result distribution across multi-tenant enterprise workflows.
- Reduced median scan-processing latency by **41%** through bounded worker pools, batch persistence, optimized serialization, and targeted **Redis** caching of frequently accessed metadata.
- Resolved a recurring production memory-growth incident caused by leaked goroutines and unbounded channels by adding context cancellation, backpressure, heap profiling, and regression tests.
- Implemented event-driven workflows with **Apache Kafka**, **AWS SQS**, and idempotent consumers to decouple long-running scans, retries, notifications, and downstream security integrations.

- Improved **PostgreSQL** query performance by redesigning indexes, eliminating N+1 access patterns, and introducing transaction boundaries that protected consistency under concurrent updates.
- Deployed containerized services to **Kubernetes on AWS**, using **Terraform**, Helm, autoscaling, health probes, and progressive delivery controls to support resilient production releases.
- Strengthened platform security with **OAuth 2.0**, **OIDC**, **RBAC**, secrets rotation, input validation, dependency scanning, and auditable authorization decisions for regulated customers.
- Expanded automated coverage with table-driven Go tests, integration suites, contract tests, and load tests while using **OpenTelemetry**, **Prometheus**, **Grafana**, and **CloudWatch** for observability.
- Led architecture reviews, incident retrospectives, and mentoring for distributed engineering teams, translating product and security requirements into phased technical roadmaps and delivery plans.

Cubic Telecom USA — Software Engineer

Remote/ Full time

January 2019 – April 2021

San Diego, CA

- Built cloud services in **Go 1.9–1.16** for connected-vehicle and IoT programs, processing device registration, subscription, roaming, telemetry, and carrier lifecycle events.
- Designed horizontally scalable ingestion services that normalized high-volume modem and network events before routing validated data to billing, analytics, and customer-facing platforms.
- Increased event-processing throughput by **35%** by rebalancing Kafka partitions, reducing serialization overhead, tuning consumer concurrency, and moving slow enrichment work off the request path.
- Eliminated duplicate provisioning requests caused by retry storms and delayed carrier acknowledgments by implementing idempotency keys, deduplication windows, and replay-safe state transitions.
- Created **Kafka** producers and consumers with dead-letter handling, ordered processing, retry policies, and schema compatibility controls for reliable communication between distributed services.
- Modeled operational data in **PostgreSQL**, **Cassandra**, and **Redis**, selecting storage patterns based on consistency, write volume, retention, and low-latency lookup requirements.
- Containerized services with Docker and deployed them through **Kubernetes** pipelines on AWS, adding readiness checks, resource limits, rolling upgrades, and environment-specific configuration.
- Developed secure **REST APIs**, **webhooks**, and **partner adapters** for mobile-network operators, applying OAuth 2.0, request signing, rate limiting, and detailed integration diagnostics.
- Collaborated with product, SRE, QA, and telecom specialists to estimate complex features, review designs, support production incidents, and improve release readiness across global programs.

Asurion — Software Developer

Remote/ Full time

January 2017 – December 2018

Nashville, TN

- Developed **Go 1.5–1.12** backend services for device-protection and customer-support workflows, integrating newer APIs with established Java and .NET systems during gradual modernization.
- Implemented claims, eligibility, fulfillment, and service-status APIs with explicit validation, versioned contracts, and fault-tolerant adapters for internal and third-party dependencies.
- Reduced average claims-processing time by **28%** by parallelizing independent validation steps, caching reference data, and removing synchronous calls from noncritical notification paths.
- Fixed an intermittent double-fulfillment defect caused by concurrent retries and non-atomic status updates by introducing database locking, idempotent commands, and traceable workflow states.
- Built asynchronous processing with **RabbitMQ** and **Kafka** for claims events, inventory updates, and customer notifications, including retry limits and poison-message isolation.
- Optimized **PostgreSQL**, **SQL Server**, and **Redis** access by adding selective indexes, consolidating repeated queries, and applying cache invalidation rules aligned with business events.
- Automated builds and deployments with **Jenkins**, **Docker**, **Git**, and scripted quality gates, making rollback procedures repeatable and reducing risk during frequent production releases.
- Partnered with analysts, support teams, and senior engineers to refine requirements, perform code reviews, troubleshoot incidents, and mentor developers on dependable Go service design.

Rustici Software — Junior Software Developer

Hybrid/ Full time

June 2015 – December 2016

Nashville, TN

- Developed backend components in **Go 1.2–1.7** for e-learning products, supporting content import, launch, tracking, reporting, and standards-based communication for SaaS customers.
- Created REST services and background workers for **SCORM**, **xAPI**, and course-processing workflows, emphasizing predictable error handling and compatibility with varied learning content.
- Modernized legacy PHP and monolithic service logic by extracting focused Go utilities and APIs, allowing incremental adoption without disrupting existing customer integrations.
- Diagnosed import failures caused by malformed manifests, inconsistent encodings, oversized packages, and timezone conversions, then added defensive parsing and actionable diagnostics.
- Improved persistence workflows across **PostgreSQL** and **MySQL** by simplifying queries, adding indexes, and using Redis caching for frequently requested course and launch metadata.
- Introduced repeatable builds, automated unit tests, Linux deployment scripts, and early Docker-based development environments to reduce workstation differences and release defects.
- Worked closely with senior developers and customer support to reproduce production issues, document fixes, review code, and deliver maintainable features within iterative release cycles.

EDUCATION

Tennessee State University — Bachelor's Degree in Computer Science

Sep 2011 – May 2015

CERTIFICATION

- **AWS Certified Developer – Associate**
- **Certified Kubernetes Application Developer (CKAD)**
- **Confluent Certified Developer for Apache Kafka**
