

Tyler Roberts

Senior Software Engineer – Angular C# (.NET) Azure/AWS

tylerrobertsdev@outlook.com | linkedin.com/in/tyler-roberts-1454473b4 | Florida, United States | +1 (321) 376-7095

SUMMARY

Senior Software Engineer with **10+ years** building enterprise web platforms across **SaaS, business operations, workflow automation, and data-driven applications**, specializing in **C#, .NET Framework 4.6–4.8, .NET Core 2.1–3.1, .NET 5–8, Angular 8–18**, and secure API-first architecture. Strong background modernizing legacy systems, resolving production defects, improving release stability, and delivering maintainable full-stack solutions with **ASP.NET Core, Web API, SQL Server, Azure, and AWS**. Known for upgrading aging platforms into scalable services, reducing failure rates by over **35%**, improving page/API performance by **40%+**, and implementing observability, CI/CD, and secure authentication patterns that support long-term product growth.

SKILLS

- **Frontend** — **Angular 8–18, TypeScript 3–5, JavaScript, RxJS, NgRx, HTML5, CSS3, SCSS, Bootstrap, Angular Material**, responsive UI architecture, reusable component systems, form validation, route guards, lazy loading, performance tuning
- **Backend & APIs** — **C#, .NET Framework 4.6–4.8, .NET Core 2.1–3.1, .NET 5–8, ASP.NET MVC, ASP.NET Core Web API, Entity Framework / EF Core**, REST APIs, microservices, background jobs, SignalR, API versioning, validation layers, exception handling, secure coding, integration services
- **Data & Messaging** — **SQL Server, PostgreSQL, MySQL, Redis, MongoDB, Dapper**, stored procedures, query tuning, indexing, caching, **RabbitMQ, Azure Service Bus, AWS SQS/SNS**, event-driven processing
- **Cloud & DevOps** — **Azure App Service, Azure Functions, Azure DevOps, Azure SQL, Azure Key Vault, AWS EC2, AWS S3, AWS RDS, Docker, Kubernetes, Terraform, CI/CD pipelines**, release automation, environment management
- **Observability, Testing & Security** — **xUnit, NUnit, Jest, Karma, Cypress, OpenTelemetry, Datadog, Grafana, Application Insights, Serilog, OAuth2, OpenID Connect, JWT, RBAC**, audit logging, structured monitoring, defect triage, root-cause analysis

EXPERIENCE

Senior Software Engineer

Web Venturez LLC

February 2020 - October 2025

- Led development of multi-module business platforms using **C#, .NET 6–8, ASP.NET Core Web API**, and **Angular 13–18**, replacing fragile monolithic workflows with service-based boundaries that improved deployment safety and reduced production regression volume by more than **35%**.
- Architected reusable **Angular** component libraries with **RxJS**, route guards, shared state patterns, and form abstractions, which reduced duplicated frontend logic across products by nearly **40%** while making new feature delivery measurably faster for the team.
- Modernized legacy backend modules from **.NET Framework 4.7** to **.NET 6/7**, resolving serialization mismatches, dependency injection issues, and authentication inconsistencies that had been causing recurring defects during staged rollouts and hotfix cycles.
- Implemented secure REST services with **JWT, OAuth2**, and policy-based authorization, ensuring consistent access rules across internal admin tools and customer-facing portals while reducing authorization-related defects discovered during QA and UAT.
- Resolved a long-running production issue caused by blocking database calls and oversized payload responses by introducing async service patterns, response shaping, and query optimization, which improved API latency by over **40%** during peak traffic windows.
- Designed background processing flows using **Azure Functions, RabbitMQ**, and scheduled workers for file imports, notifications, and retry-safe business events, which eliminated several manual support tasks and improved processing reliability across high-volume operations.
- Introduced **Redis** caching for lookup-heavy APIs and dashboard endpoints, reducing repeated database pressure and stabilizing response times during reporting spikes, especially in modules that previously suffered from timeout and locking behavior.
- Strengthened database performance with **SQL Server** indexing reviews, stored procedure refactoring, and execution plan analysis, which reduced slow-query incidents by around **30%** and improved consistency for search, reporting, and transactional workflows.

- Integrated **Application Insights**, **OpenTelemetry**, and structured **Serilog** logging to improve observability across frontend and backend services, giving engineers clearer defect reproduction paths and cutting troubleshooting time by more than **50%** in several incidents.
- Built and maintained **Azure DevOps** and container-based CI/CD pipelines that automated testing, packaging, and deployments, significantly reducing release friction and helping the team move from risky manual releases to repeatable promotion workflows.
- Delivered complex UI features in **Angular Material** including approval queues, audit timelines, dynamic forms, and administrative dashboards, with strong attention to accessibility, responsive behavior, and validation flows required by business users.
- Mentored engineers on migration planning, defect isolation, API contract discipline, and full-stack delivery practices, helping the team handle urgent bugs, legacy cleanup, and new feature work without sacrificing code quality or release confidence.

Software Engineer

Webiz Digital

July 2017 - January 2020

- Built customer-facing web applications using **ASP.NET MVC**, **ASP.NET Core**, **Angular 8–12**, and **SQL Server**, delivering full-stack modules for reporting, case handling, and workflow management in environments where stability and maintainability were critical.
 - Refactored legacy server-rendered pages into structured **Angular** frontends with shared services and reusable components, which improved user experience, reduced duplicated UI logic, and made future interface enhancements substantially easier to implement.
 - Developed RESTful backend endpoints in **C#** and **ASP.NET Core Web API** to support dashboards, search tools, and transactional workflows, with consistent validation and error contracts that reduced frontend/backend integration confusion during testing.
 - Fixed a recurring issue involving stale records and inconsistent updates by introducing optimistic concurrency handling, stricter transaction boundaries, and clearer API response messaging that prevented duplicate user actions in high-traffic modules.
 - Migrated several internal services from older **ASP.NET MVC** patterns to **ASP.NET Core 3.1**, resolving dependency registration issues, middleware ordering bugs, and outdated configuration handling that had previously slowed deployments and debugging.
 - Implemented authentication and session controls using **JWT**, claims-based authorization, and secure token handling patterns, resulting in improved protection for sensitive modules and fewer permission-related incidents reported by operations teams.
 - Improved frontend performance by introducing lazy-loaded feature modules, smarter subscription handling with **RxJS**, and reduced payload rendering costs, which noticeably improved navigation speed and lowered browser-side memory waste.
 - Designed integration flows for email notifications, third-party APIs, and batch import processing, while adding better exception handling and retry logic so transient errors stopped creating silent failures and support escalations.
 - Optimized relational queries in **SQL Server** and **MySQL** by rewriting joins, refining indexes, and simplifying reporting procedures, which improved responsiveness for data-heavy screens and reduced the operational burden on shared database resources.
 - Supported CI/CD and release workflows using **Azure DevOps**, **Git**, and scripted deployment checks, giving the team stronger release traceability and reducing human error during deployments across staging and production environments.
 - Worked closely with QA, product stakeholders, and support teams to reproduce defects, isolate edge cases, and ship practical fixes quickly, building a reputation for solving both visible UI bugs and deeper service-layer reliability issues.
-

Software Developer

Centric Tech Inc.

October 2013 - June 2017

- Developed line-of-business applications with **C#, ASP.NET MVC, AngularJS / early Angular, JavaScript, and SQL Server**, contributing to internal systems that handled operational workflows, customer records, approvals, and reporting needs.
- Maintained and enhanced legacy **.NET Framework 4.6–4.8** modules, fixing validation gaps, inconsistent null handling, and brittle business-rule implementations that had caused frequent user-facing defects and repeated support interventions.
- Created backend services, controller actions, and data-access layers for form-heavy systems, emphasizing maintainable logic separation and predictable behavior in applications that had originally grown with very limited architectural discipline.
- Resolved several high-impact production bugs related to stored procedure failures, malformed request payloads, and missing server-side validation by tracing execution paths carefully and applying durable fixes rather than temporary patches.
- Improved frontend behavior in older **AngularJS** and JavaScript modules by cleaning up watchers, form bindings, and state transitions, which reduced erratic UI behavior and improved reliability in data entry and approval screens.
- Worked on early migration efforts that moved selected modules away from tightly coupled MVC pages toward more structured client/server interactions, laying the groundwork for later transitions into modern **Angular** and API-driven delivery.
- Enhanced database stability through table normalization updates, index tuning, and safer query patterns, reducing locking and timeout issues that had previously affected concurrent users during peak daily processing periods.
- Added logging and diagnostic detail to critical business flows so that hidden failures became easier to reproduce, enabling faster debugging and reducing the number of unresolved tickets returning from QA or business users.
- Assisted with deployment preparation, release validation, and environment support for multiple internal applications, gaining strong experience in production troubleshooting, patch verification, and defect turnaround under time-sensitive conditions.
- Collaborated with senior engineers and business analysts to translate vague process requirements into working features, gradually taking ownership of more complex backend logic and full-stack change sets as product trust increased.

EDUCATION

Bachelor's degree in Computer Science

Florida State University

2009 - 2013

- Built a strong foundation in algorithms, databases, software engineering, and system design, then applied those fundamentals through practical team projects focused on maintainability, data correctness, and production-style problem solving.
