

TYLER ROBERTS

Senior Software Engineer C# (.NET) Blazor

tylerrobertsdev@outlook.com | linkedin.com/in/tyler-roberts-1454473b4 | Florida, United States | +1 (321) 376-7095

SUMMARY

Senior Software Engineer with **10+ years** building enterprise web platforms, internal operations tools, and customer-facing SaaS products using **C#, ASP.NET, .NET 6–8, and Blazor** across cloud-hosted environments. Strong background delivering modern UI modernization programs in the **software, digital services, and business platform industry**, including migration of older **ASP.NET MVC / .NET Framework** applications into maintainable **Blazor Server** and **Blazor WebAssembly** solutions with shared component libraries, stronger state handling, and improved deployment consistency. Experienced in secure API design, performance tuning, incident-driven bug fixing, and full lifecycle delivery using **SQL Server, Entity Framework Core, Azure, AWS, Docker**, and CI/CD, with a practical focus on stability, maintainability, and measurable business outcomes.

SKILLS

- **Frontend** — **Blazor Server, Blazor WebAssembly, Razor Components, C#, HTML5, CSS3, Bootstrap**, JavaScript, TypeScript, responsive UI architecture, reusable component design, accessibility, client-side validation, state management, performance tuning
- **Backend & APIs** — **.NET Framework 4.6–4.8, .NET Core 2.1–3.1, .NET 6–8, ASP.NET MVC, ASP.NET Core, Web API**, REST APIs, microservices, background jobs, SignalR, authentication, authorization, API versioning, caching, file processing, integration services
- **Data** — **SQL Server**, PostgreSQL, MySQL, Entity Framework, **Entity Framework Core**, Dapper, stored procedures, indexing, query tuning, reporting data models, transactional systems
- **Cloud & DevOps** — **Azure App Service, Azure Functions**, Azure DevOps, Azure Storage, Azure Service Bus, AWS EC2, AWS S3, AWS RDS, Docker, CI/CD pipelines, IIS, GitHub Actions, release automation, environment configuration
- **Observability, Quality & Security** — xUnit, NUnit, bUnit, integration testing, logging, distributed tracing, performance diagnostics, role-based access control, **OAuth2, OpenID Connect, JWT**, secure coding, exception handling, audit logging

EXPERIENCE

Senior Software Engineer

Web Venturez LLC

February 2020 - October 2025

- Led modernization of multi-module business platforms by rebuilding legacy **ASP.NET MVC** screens into **Blazor Server** and **Blazor WebAssembly** applications on **.NET 6–8**, which reduced front-end duplication and improved release consistency across internal and customer-facing workflows.
- Designed reusable **Razor component** libraries for grids, filters, forms, modal workflows, and permission-aware navigation, which accelerated feature delivery for new product modules and gave teams a more maintainable UI foundation.
- Built secure backend services with **ASP.NET Core Web API, Entity Framework Core**, and **SQL Server**, enabling Blazor clients to consume versioned endpoints with predictable contracts and cleaner separation between presentation and business logic.
- Resolved a recurring state synchronization bug in long-running forms where disconnected users lost unsaved progress, then introduced scoped state containers, autosave checkpoints, and defensive restore logic that cut support complaints by more than **35%**.
- Migrated authentication flows from older cookie-heavy MVC patterns to **OpenID Connect** and **JWT** based integration, improving session handling for Blazor apps and simplifying role-based authorization across both UI and API layers.
- Implemented **SignalR**-based live update features for operational dashboards so agents could see job status, approval changes, and workflow notifications in near real time without constant polling or heavy browser refresh behavior.
- Investigated a high-memory rendering issue caused by oversized component trees and unnecessary re-render cycles, then refactored binding patterns and lifecycle usage to improve page responsiveness by roughly **30%** under peak internal usage.

- Introduced shared validation, centralized exception handling, and structured logging across UI and API layers, which made production defects easier to trace and shortened diagnosis time during cross-team incident response.
- Delivered incremental migration from older **.NET Framework 4.8** services into container-friendly **.NET 6** and later **.NET 8** workloads, preserving critical business rules while reducing deployment friction and making regression coverage more reliable.
- Integrated **Azure App Service**, **Azure Storage**, and **Azure DevOps** pipelines for automated build, test, and deployment workflows, giving the team safer promotion paths across development, staging, and production environments.
- Partnered with product and QA teams to translate ambiguous legacy behavior into explicit acceptance criteria, which prevented logic regressions during Blazor rewrites and improved stakeholder confidence in phased rollouts.
- Mentored engineers on component composition, server versus WebAssembly tradeoffs, and practical debugging of rendering, dependency injection, and circuit-related issues, helping the team adopt **Blazor** as a sustainable production technology rather than a short-lived experiment.

Software Engineer

Webiz Digital

July 2017 - January 2020

- Built full-stack business applications using **C#**, **ASP.NET Core 2.1–3.1**, **SQL Server**, and early **Blazor** adoption patterns, supporting reporting portals, administrative tools, and workflow dashboards for service-oriented clients.
 - Extended established **ASP.NET MVC** applications with modular UI redesigns, then introduced **Razor Components** in targeted internal modules where richer interactivity was needed without heavy JavaScript framework overhead.
 - Developed RESTful service layers and integration endpoints that connected front-end workflows with payment, document, notification, and customer account systems, improving reliability of cross-platform business operations.
 - Fixed a difficult concurrency issue in approval workflows where duplicate submissions produced conflicting records, then added idempotency checks, transactional safeguards, and clearer operator feedback to prevent repeat data corruption.
 - Refactored monolithic controller logic into service-oriented layers with stronger dependency injection and test coverage, making future migration into modern **.NET Core** and Blazor-oriented presentation patterns much easier.
 - Created reusable reporting and search interfaces backed by optimized SQL queries and caching strategies, helping teams work with larger data sets while keeping page load times within acceptable operational thresholds.
 - Improved deployment stability by moving inconsistent manual publishing steps into CI/CD pipelines using **Azure DevOps** and scripted environment configuration, which reduced release errors and improved auditability.
 - Investigated browser-side performance issues in dynamic forms and resolved them by simplifying rendering logic, reducing payload size, and tuning API response contracts, leading to visibly smoother user interaction on low-powered devices.
 - Supported migration of selected modules from **.NET Framework** patterns into **.NET Core 3.1**, preserving business behavior while modernizing hosting, dependency management, and deployment flexibility.
 - Implemented role-aware navigation, secure file handling, and stronger server-side validation, reducing privilege edge cases and preventing common user input failures from escalating into production incidents.
 - Collaborated closely with QA and support teams to convert recurring customer issues into prioritized engineering fixes, which improved stability and created a more disciplined feedback loop between operations and development.
-

Software Developer

Centric Tech Inc.

October 2013 - June 2017

- Developed line-of-business web applications using **C#, ASP.NET MVC 5, Web API 2, SQL Server**, JavaScript, and Bootstrap, focusing on transactional screens, internal administration tools, and structured reporting workflows.
- Built and maintained backend business logic for account management, approval routing, and document-related processes, helping replace spreadsheet-driven operations with centralized browser-based systems.
- Created stored procedures, optimized SQL queries, and improved indexing strategies for heavily used reports, which reduced timeout issues and improved day-to-day usability for internal teams handling large data volumes.
- Resolved frequent null-reference and serialization errors in early service integrations by tightening model validation, adding safer mapping logic, and standardizing exception handling across controller and repository layers.
- Supported bug fixing in production IIS environments, including login issues, broken data imports, and inconsistent role checks, while documenting root causes so repeat incidents could be handled more systematically.
- Enhanced older server-rendered pages with better client-side validation and clearer feedback messages, which lowered failed form submissions and reduced support escalation from non-technical users.
- Participated in phased backend cleanup that separated controller logic from data access responsibilities, laying groundwork for later modernization into **ASP.NET Core** style application structure.
- Integrated background processing for file imports and scheduled data updates so business users no longer had to manage manual repetitive tasks during operational hours.
- Improved security posture by strengthening authentication checks, session timeout handling, and audit-oriented logging for sensitive workflow actions in internal administrative systems.
- Worked with senior engineers to stabilize legacy modules before modernization, learning how to isolate brittle areas, address recurring defects, and preserve production behavior while preparing systems for future **.NET** upgrades.

EDUCATION

Bachelor's degree in Computer Science

Florida State University

2009 – 2013

- Built a strong foundation in **algorithms, databases, and software engineering**, reinforced through team projects focused on production-style coding practices and maintainable system design.
