

Tyler Roberts

Senior Software Engineer – React C# (.NET) Azure/AWS

tylerrobertsdev@outlook.com | linkedin.com/in/tyler-roberts-1454473b4 | Florida, United States | +1 (321) 376-7095

SUMMARY

Senior Software Engineer with **10+ years** of experience building scalable full-stack platforms using **C#, .NET 6–8, ASP.NET Core, React 16–18**, and **TypeScript** across **SaaS, business automation, and data-driven web application** environments. Strong background delivering secure APIs, modern frontend architecture, cloud-based deployments, and legacy modernization initiatives that improved performance, stability, and delivery speed. Proven success resolving complex production issues, migrating older **.NET Framework** applications to modern **.NET**, and implementing new product features with a pragmatic, reliability-focused engineering approach.

SKILLS

- **Frontend** — **React 16–18, TypeScript 4–5**, JavaScript, HTML5, CSS3, Tailwind CSS, Bootstrap, Redux Toolkit, React Query, responsive UI architecture, component libraries, SPA routing, performance optimization
- **Backend & APIs** — **C#, .NET 6–8, ASP.NET Core**, Web API, MVC, RESTful APIs, microservices, background jobs, Entity Framework Core, LINQ, authentication, authorization, API versioning, caching, rate limiting, secure coding
- **Database & Data** — **SQL Server**, PostgreSQL, MySQL, Redis, database design, query tuning, indexing, stored procedures, transactional workflows, reporting pipelines
- **Cloud & DevOps** — **AWS, Azure**, Docker, Kubernetes, CI/CD pipelines, GitHub Actions, Jenkins, Terraform, CloudFormation, S3, RDS, EC2, Lambda, API Gateway
- **Observability, Quality & Security** — OpenTelemetry, Datadog, Grafana, Prometheus, structured logging, unit testing, integration testing, Jest, xUnit, Playwright, OAuth2, OpenID Connect, JWT, RBAC, audit logging

EXPERIENCE

Senior Software Engineer

Web Venturez LLC

February 2020 - October 2025

- Architected and delivered multi-tenant business platforms using **C#, .NET 6–8, ASP.NET Core, React 17–18**, and **TypeScript**, improving feature delivery consistency while keeping API contracts stable across internal and customer-facing applications.
- Led modernization of legacy modules from older **.NET Framework** implementations into modern **ASP.NET Core** services, reducing deployment friction, improving maintainability, and eliminating recurring runtime compatibility issues seen during prior release cycles.
- Built reusable **React** component patterns and state management flows that improved dashboard responsiveness and form-heavy user workflows, helping product teams release complex administrative tools with fewer UI regressions.
- Designed and maintained secure **REST APIs** with **JWT, RBAC**, validation guardrails, and audit-friendly request handling, strengthening platform security for sensitive business actions and reducing authorization-related defects in production.
- Resolved high-impact production bugs involving race conditions, stale cache reads, and inconsistent database updates by introducing safer transaction boundaries, retry protections, and more predictable background job orchestration.
- Implemented **Redis** caching and query optimization strategies across frequently accessed endpoints, reducing database pressure during peak traffic periods and noticeably improving response times for search and reporting screens.
- Expanded cloud deployment practices using **AWS** and **Azure** services with containerized workloads, enabling more repeatable environment promotion and reducing configuration drift between development, staging, and production systems.
- Improved release reliability by strengthening **CI/CD** workflows with automated validation, build checks, and deployment controls, which lowered failed deployment frequency and shortened rollback decision time during critical incidents.
- Collaborated with product and design stakeholders to implement new customer-facing features in **React**, translating ambiguous requirements into maintainable UI and backend changes without disrupting established user workflows.

- Introduced observability improvements through structured logging, trace instrumentation, and operational dashboards using **OpenTelemetry**, **Datadog**, and **Grafana**, making it much easier to isolate bottlenecks and shorten incident resolution time.
- Supported integration-heavy features involving third-party APIs, file workflows, and asynchronous processing, resolving edge-case failures through defensive error handling, contract validation, and better timeout and retry strategies.
- Mentored engineers on practical full-stack delivery patterns across **.NET** and **React**, helping standardize coding approaches, reduce avoidable review churn, and improve implementation quality on shared platform initiatives.

Software Engineer

Webiz Digital

July 2017 - January 2020

- Developed web applications using **C#**, **ASP.NET**, **React 16**, JavaScript, and relational databases, delivering business workflow tools that balanced maintainable backend logic with responsive client-side user experiences.
- Created modular frontend features for internal and customer-facing dashboards, improving usability in data-heavy screens through cleaner component composition, better state handling, and more predictable rendering behavior.
- Built and maintained backend services for form processing, reporting, and account-based workflows, ensuring reliable data persistence and smoother interaction between application layers and database services.
- Addressed recurring production defects related to null reference errors, inconsistent validation paths, and fragile API assumptions by tightening request models, validation logic, and exception handling throughout the stack.
- Participated in migration work that replaced older server-rendered pages with more interactive **React**-based interfaces, improving maintainability and making it easier to ship new features without rewriting entire modules.
- Optimized SQL queries, indexes, and data access patterns for slower pages and reporting endpoints, reducing timeouts and helping support teams handle customer complaints related to degraded performance more effectively.
- Integrated third-party services for payments, notifications, and administrative workflows, resolving interoperability issues through stronger response parsing, fallback handling, and improved logging for external dependency failures.
- Worked closely with QA and product stakeholders to implement new functionality with clear acceptance behavior, reducing rework by aligning backend validation and frontend interaction flows before final release cycles.
- Supported deployment and environment configuration tasks across cloud-hosted and traditional application infrastructure, helping stabilize releases and reduce surprises caused by environment-specific settings differences.
- Improved frontend reliability by fixing state synchronization issues, race conditions in asynchronous requests, and rendering bugs that affected key user journeys in account management and data entry workflows.
- Contributed across the full lifecycle of planning, implementation, debugging, and post-release support, using a flexible engineering approach that allowed shifting between **React**, backend services, database fixes, and deployment work as needed.

Software Developer

Centric Tech Inc.

October 2013 - June 2017

- Built and maintained business web applications using **C#**, early **ASP.NET**, JavaScript, jQuery, HTML, CSS, and **SQL Server**, focusing on stable CRUD workflows, reporting modules, and internal operational tooling.
- Developed backend logic for data processing, validation, and role-based workflow actions, helping the team deliver practical business features while maintaining consistency across shared database-driven applications.
- Investigated and fixed common legacy issues such as duplicated records, broken form submissions, and inconsistent server-side validation by tracing failure paths carefully and applying targeted code and schema corrections.

- Enhanced existing application modules with new functionality rather than full rewrites, which allowed the team to extend useful systems incrementally while minimizing operational risk for business users.
- Improved stored procedures and query structures that had become slow under growing data volume, reducing page load times and improving reliability for teams dependent on reporting and search-heavy screens.
- Supported production troubleshooting by analyzing logs, reproducing defects, and deploying safe fixes for UI and backend issues, which strengthened confidence in the team's ability to stabilize older systems quickly.
- Worked on authentication, permissions, and administrative tools that required careful handling of user roles and protected actions, building a stronger understanding of secure application behavior in enterprise environments.
- Collaborated with senior engineers to introduce cleaner layering between UI, business logic, and database access, helping older code become easier to test, debug, and extend over time.
- Handled bug fixing, enhancement requests, and maintenance work across multiple parallel applications, demonstrating flexibility by moving between frontend adjustments, backend logic changes, and database troubleshooting as priorities shifted.
- Built a strong engineering foundation in maintainable web development, production support, and incremental modernization that later supported successful transition into larger-scale **.NET** and **React** platform work.

EDUCATION

Bachelor's degree in Computer Science

Florida State University

2009 – 2013

- Built a strong foundation in **algorithms**, **databases**, and **software engineering**, with practical coursework that supported production-oriented backend and web platform development.
