

William Jackson

Senior Software Engineer - Angular Java (Spring Boot) AWS/GCP

Wellington, Nevada, United States | +1 (786) 949-7561 | williamjackson.pro@outlook.com | [linkedin.com/in/william-jackson-75b9343b6](https://www.linkedin.com/in/william-jackson-75b9343b6)

PROFESSIONAL SUMMARY

Senior Software Engineer with 10+ years of experience designing and delivering enterprise-grade applications across **SaaS, business workflow, internal platform, and data-driven product engineering** environments, with strong specialization in **Java 8–21, Spring Boot 2.x–3.x, Angular 8–18, TypeScript 3.x–5.x**, and cloud-native distributed systems. Proven success building secure APIs, modernizing legacy platforms, resolving high-impact production defects, and leading migration work from monolithic or older framework implementations into scalable service-oriented architectures. Known for improving reliability, reducing incident volume, accelerating delivery velocity, and implementing maintainable frontend and backend foundations that support long-term product growth.

SKILLS

- **Frontend: Angular 8–18, TypeScript 3.x–5.x**, JavaScript ES6+, RxJS 6.x–7.x, NgRx, Angular Material, Reactive Forms, standalone component architecture, lazy loading, route guards, reusable UI systems, HTML5, CSS3, SCSS, responsive design, accessibility-focused development, component-driven architecture
- **Backend & APIs: Java 8–21, Spring Boot 2.x–3.x**, Spring MVC, Spring Security, Spring Data JPA, Hibernate 5.x–6.x, REST API design, microservices, JWT authentication, OAuth2, OpenID Connect, RBAC, API versioning, file processing, batch jobs, asynchronous processing
- **Data, Messaging & Search: PostgreSQL, MySQL**, SQL Server, Redis, MongoDB, DynamoDB, Kafka, RabbitMQ, AWS SQS/SNS, Elasticsearch, OpenSearch, Redshift, BigQuery
- **Cloud & DevOps: AWS**, Azure, GCP, Docker, Kubernetes, Helm, Terraform, CloudFormation, GitHub Actions, GitLab CI, Jenkins, EKS, ECS, EC2, Lambda, API Gateway, S3, CloudFront, RDS, DynamoDB, ElastiCache, EventBridge, Step Functions, IAM, Nginx, Linux
- **Observability, Quality & Security: OpenTelemetry**, Datadog, Prometheus, Grafana, ELK/EFK, CloudWatch, JUnit, Mockito, Cypress, Playwright, Pact-style contract testing, OAuth2, OpenID Connect, JWT, Okta, Auth0, AWS Cognito, audit logging, rate limiting, RBAC, ABAC

WORK HISTORY

Senior Software Engineer

February 2021 to December 2025

Viario Networks Inc. - Delaware, United States

- Architected and delivered enterprise web platforms using **Java 17, Spring Boot 3.x, Angular 15–18**, and **PostgreSQL**, building modular backend services and rich client workflows that supported complex multi-team business operations at scale.
- Led a major modernization effort that migrated a legacy **Spring MVC** and older Angular codebase into **Spring Boot** microservices and a modern **Angular** SPA, reducing deployment friction by **42%** and making feature delivery far more predictable.
- Designed secure **REST APIs** with **JWT, OAuth2, and RBAC**, giving frontend and integration teams a stable contract model while improving authorization consistency across business-critical modules.
- Implemented reusable **Angular** component libraries with shared form controls, validation patterns, and state-handling conventions, which cut duplicate UI code by **35%** and improved delivery speed across several product streams.
- Solved a recurring production issue where high-concurrency update flows caused stale writes and inconsistent UI refresh behavior, then resolved it through transaction boundary adjustments, optimistic locking, and frontend synchronization fixes.
- Introduced **Kafka** and **AWS SQS/SNS** based event workflows for asynchronous notifications, audit events, and downstream processing, which improved throughput and reduced request-time coupling between services.
- Refactored slow database paths in **PostgreSQL** by redesigning indexes, query patterns, and pagination strategies, bringing several high-volume endpoints from multi-second latency down to consistently acceptable response times.
- Built CI/CD pipelines with **GitHub Actions, Docker, and Kubernetes**, allowing repeatable test, build, and release flows that reduced manual deployment activity by **50%** and improved rollback confidence.

- Added end-to-end observability through **OpenTelemetry**, **Datadog**, **Prometheus**, and **Grafana**, making it easier to isolate memory pressure, latency regressions, and failed job patterns before they became customer-facing incidents.
- Worked closely with product and QA partners to implement new workflow features in areas such as approvals, dashboards, and reporting, translating ambiguous requirements into maintainable technical solutions with measurable delivery outcomes.
- Resolved a difficult memory leak in a long-running background processing service by tracing object retention across caching and serialization layers, then restructuring lifecycle management to stabilize container memory usage in production.
- Improved release quality with stronger automated coverage using **JUnit**, **Mockito**, **Cypress**, and contract validation practices, helping lower regression volume by **28%** across heavily used frontend and API surfaces.
- Mentored engineers on **Spring Boot**, **Angular**, code review standards, and debugging methods, strengthening team delivery discipline while keeping architecture decisions aligned with long-term maintainability goals.

Software Engineer

October 2018 to January 2021

Avantia, Inc. - Ohio, United States

- Developed customer-facing and internal applications using **Java 11**, **Spring Boot 2.x**, **Angular 9–11**, and **MySQL**, focusing on scalable business workflows, operational reporting, and API-connected interfaces.
- Built modular backend services for account, transaction, and administrative workflows, creating well-structured service boundaries that made later microservice separation much easier for the platform team.
- Implemented dynamic **Angular** screens with **RxJS**, **Reactive Forms**, and role-aware navigation logic, improving usability for operational users who relied on fast multi-step form completion.
- Investigated an intermittent issue where frontend state desynchronization caused duplicate submissions during poor network conditions, then resolved it with request guards, button-locking logic, and server-side idempotency validation.
- Contributed to migration work that replaced older server-rendered pages with **Angular** driven UI modules, improving responsiveness, reducing page reload overhead, and supporting a more modern product experience.
- Designed and consumed secure **REST APIs** with **Spring Security** and **JWT**, allowing frontend modules and third-party integrations to operate against more consistent and well-documented service contracts.
- Optimized several slow reporting queries by adjusting joins, indexing, and summary-table usage in **MySQL**, producing response-time improvements of **31%** in heavily used reporting paths.
- Added **Redis** caching to frequently accessed reference data and read-heavy endpoints, lowering repeated database load and smoothing performance during high-traffic internal usage periods.
- Supported containerized deployment improvements using **Docker**, Jenkins, and AWS-hosted infrastructure, helping standardize environments and reduce configuration drift between lower and production stages.
- Implemented structured logging and monitoring integrations that improved visibility into failed jobs, malformed requests, and authentication-related errors, which shortened investigation cycles for support and engineering teams.
- Partnered with stakeholders to ship new business features while balancing technical debt reduction, ensuring the system remained stable during active expansion of reporting, workflow, and permissions functionality.

Software Developer

March 2016 to September 2018

ArnAmy, Inc. - Florida, United States

- Built and enhanced line-of-business applications using **Java 8**, **Spring**, **AngularJS** transitioning into early **Angular**, and **SQL Server**, supporting internal process automation and customer data workflows.
- Developed backend modules for user management, approvals, reporting, and document-linked operations, helping move manual team processes into consistent web-based application flows.
- Participated in frontend modernization by helping migrate selected screens from older AngularJS patterns toward more maintainable component-based structures, reducing UI fragility and improving code organization.
- Fixed a recurring defect where date and timezone handling created inconsistent records between UI and backend services, then standardized parsing and serialization behavior to remove a common source of reporting errors.

- Implemented validation rules and backend safeguards that reduced bad data submissions and improved business rule enforcement for complex multi-step operational forms.
- Improved SQL performance by rewriting stored procedures, cleaning up query joins, and aligning indexing with real usage patterns, which reduced delays in dashboard and export-heavy workflows.
- Integrated email and background processing behavior for notifications and scheduled business jobs, making operational tasks more reliable and less dependent on manual intervention.
- Worked on secure session handling, permission controls, and audit-oriented logging so that sensitive workflows had clearer traceability and better access governance.
- Helped troubleshoot production defects involving null handling, unexpected payload shapes, and brittle legacy service behavior, applying targeted fixes that improved stability during active feature growth.
- Collaborated with senior engineers on code cleanup and modularization efforts that made the platform easier to maintain and prepared the codebase for later framework and architecture upgrades.

Junior Software Developer

October 2014 to February 2016

Centric Tech Inc. - New Jersey, United States

- Supported web application development using **Java 7–8**, **Spring MVC**, JavaScript, jQuery, and relational databases, contributing to internal systems and customer-facing business tools.
- Implemented smaller backend features, form workflows, and data-handling logic while learning production development practices around maintainability, testing, and team collaboration.
- Assisted with bug fixing across UI and service layers, including issues related to null values, validation gaps, and inconsistent response handling that affected routine operational usage.
- Tracked down a stubborn defect where repeated browser actions created duplicate records, then helped correct the root cause through controller-side checks and improved frontend submission control.
- Updated legacy screens and request flows with clearer validation messaging and safer field handling, making day-to-day user interactions more reliable and easier for support teams to troubleshoot.
- Contributed to SQL query updates, reporting fixes, and small performance improvements that helped reduce operational friction for teams relying on data exports and administrative dashboards.
- Participated in deployment and release support activities, gaining practical experience with build pipelines, log review, issue verification, and post-release defect resolution.
- Helped document recurring issues, development patterns, and support findings so the team could resolve known problems faster and onboard new contributors more effectively.
- Built a strong engineering foundation in debugging, layered architecture, and business application development that supported later progression into full-stack and platform-focused responsibilities.

EDUCATION

Bachelor's degree in Computer Science

2010 to 2014

Stanford University Department of Computer Science

- Built strong foundations in algorithms, databases, software engineering, and distributed application design, then applied that knowledge through team-based implementation work and production-style system thinking.

CERTIFICATIONS

- **Oracle Certified Professional: Java SE Programmer — 2023**
Validates strong knowledge of **core Java**, object-oriented programming, collections, exception handling, and multithreading, making it one of the most credible certifications for backend-focused **Java** engineers.
- **AWS Certified Developer – Associate — 2024**
Demonstrates hands-on ability to build, deploy, and troubleshoot cloud-native applications using **AWS** services such as **Lambda**, **API Gateway**, **S3**, **IAM**, and event-driven integrations commonly used in modern Java platforms.
- **Professional Scrum Master I (PSM I) — 2022**
Shows practical understanding of **Agile** delivery, sprint execution, stakeholder collaboration, and team coordination, which is valuable for engineers working in fast-moving product teams using **Java** and **Angular**.
