

Willam Jackson

Senior Software Engineer – React PHP (Laravel/Symfony) AWS/Azure/GCP

Wellington, Nevada, United States | +1 (786) 949-7561 | williamjackson.pro@outlook.com | linkedin.com/in/william-jackson-75b9343b6

PROFESSIONAL SUMMARY

Senior Software Engineer with 10+ years of experience delivering modern web platforms across the **SaaS, digital products, enterprise software, and customer-facing platform engineering** industries, with deep specialization in **PHP 5.6–8.3, Laravel 5–10, React 15–18**, scalable API design, frontend modernization, and cloud-based application delivery. Strong history of improving release reliability, resolving production defects, reducing response time by **32%**, increasing feature delivery speed by **38%**, and leading legacy migration initiatives from server-rendered PHP systems into modular **React** and service-oriented platforms while maintaining secure, maintainable, and high-performing products.

SKILLS

- **Frontend: React 15–18**, JavaScript, TypeScript, Redux, Context API, HTML5, CSS3, Sass, Bootstrap, Tailwind CSS, Responsive UI, Component Architecture, SPA Development, Webpack, Vite, Jest, React Testing Library
- **Backend & APIs: PHP 5.6–8.3, Laravel 5–10**, Symfony, CodeIgniter, REST API Development, MVC Architecture, Authentication, Authorization, Session Management, API Integration, Monolith Refactoring, Backend Performance Optimization
- **Data & Messaging:** MySQL, PostgreSQL, Redis, SQL Query Optimization, Caching, Background Jobs, Queues, Elasticsearch
- **Cloud & DevOps:** AWS, EC2, S3, RDS, CloudFront, Route 53, Docker, Nginx, Apache, CI/CD, GitHub Actions, GitLab CI, Jenkins, Linux, Shell Scripting
- **Observability, Quality & Security:** PHPUnit, Jest, Cypress, API Validation, Logging, Monitoring, Error Tracking, OAuth, JWT, RBAC, CSRF Protection, Secure Session Handling, Release Management, Production Troubleshooting

WORK HISTORY

Senior Software Engineer

February 2021 to December 2025

Viaro Networks Inc. - Delaware, United States

- Architected and delivered customer-facing web platforms using **PHP 8.0–8.3, Laravel 8–10**, and **React 17–18**, establishing a cleaner separation between frontend presentation and backend domain services for faster product iteration.
- Led a modernization effort that migrated a large legacy PHP module into reusable **React** components and **Laravel** API endpoints, which reduced average page interaction latency by **32%** and improved maintainability across multiple teams.
- Designed secure **RESTful** services for account workflows, payment-related integrations, internal dashboards, and admin controls, allowing new product capabilities to be released without tightly coupling business logic to blade-rendered templates.
- Resolved a recurring production issue caused by inefficient database joins and repeated server-side rendering calls, then introduced Redis-backed caching and optimized SQL execution paths that lowered peak load failures by **41%**.
- Implemented a shared frontend component model with **React**, form validation standards, and state-handling patterns that improved development consistency and shortened UI delivery cycles by **38%** across active roadmap items.
- Reworked the release pipeline using **Docker**, GitHub Actions, and controlled deployment validation, which reduced rollback incidents by **27%** and gave engineering clearer visibility into environment-specific failures.
- Investigated intermittent authentication defects related to token refresh timing and stale session state, then redesigned session handling and API retry logic to eliminate a class of user-facing login interruptions.
- Built background job processing for notification, reporting, and data synchronization tasks using Laravel queue patterns, removing expensive synchronous operations from request flows and stabilizing response times during peak traffic.

- Partnered with product and design teams to implement new customer workflows in **React**, translating complex requirements into reusable frontend modules while preserving accessibility, responsiveness, and business-rule accuracy.
- Strengthened application security by tightening validation rules, standardizing role-based access logic, and closing several request-forgery and authorization edge cases discovered during internal release reviews.
- Mentored engineers on flexible use of **Laravel** service containers, repository patterns, and **React** composition practices so teams could extend features more safely without introducing duplicate logic or brittle dependencies.
- Supported cloud-hosted workloads on AWS infrastructure with improved logging, error tracing, and operational runbooks, enabling faster root-cause analysis for production bugs and more predictable recovery handling.

Software Engineer
Avantia, Inc. - Ohio, United States

October 2018 to January 2021

- Built and enhanced internal and customer-facing applications using **PHP 7.2–7.4**, **Laravel 5.8–8**, and **React 16–17**, helping the company transition from heavily template-driven pages toward a more modular frontend architecture.
- Delivered reusable REST APIs for account management, reporting, and operational workflows so frontend teams could move faster with **React** while backend logic remained centralized, testable, and easier to version.
- Improved a slow reporting feature by rewriting N+1-heavy ORM queries, restructuring indexes, and introducing targeted response caching, which reduced report generation time by **46%** for common business scenarios.
- Modernized legacy jQuery-based screens into structured **React** interfaces with predictable component behavior, better form handling, and clearer state boundaries, significantly reducing frontend regression frequency during releases.
- Solved an issue where long-running import jobs caused timeout failures and duplicate writes, then introduced queue-based processing and idempotent retry handling that improved job completion reliability by **34%**.
- Integrated third-party APIs for payments, document services, and user notifications while creating error-handling layers that gracefully managed partial failures instead of exposing raw exceptions to end users.
- Contributed to a migration path from older PHP service patterns to more maintainable Laravel conventions, including improved dependency injection, cleaner validation flow, and clearer boundaries between controllers and business logic.
- Worked closely with QA to strengthen test coverage using **PHPUnit** and frontend validation checks, making new feature delivery safer and improving confidence in deployments involving high-traffic modules.
- Implemented role-aware admin tools and dashboard enhancements that gave operations teams better visibility into user activity, issue triage, and support actions without requiring direct database intervention.
- Reduced release friction by standardizing Git workflows, environment configuration handling, and CI checks, which helped the team catch configuration drift earlier and improve deployment success rates by **23%**.
- Helped engineers use **React** and **Laravel** more flexibly by documenting practical patterns for component reuse, API pagination, validation consistency, and backend extension points that fit the product's delivery model.

Software Developer
ArnAmy, Inc. - Florida, United States

March 2016 to September 2018

- Developed business web applications using **PHP 7.0–7.2**, **Laravel 5.1–5.6**, early **React 15–16**, JavaScript, and MySQL, supporting both customer workflows and internal operations features in a growing product environment.
- Built backend modules for user administration, form processing, reporting, and approval workflows, focusing on maintainable controller logic, reusable service code, and query patterns that performed reliably in production.
- Participated in the introduction of **React** for interactive screens that had previously depended on server-rendered views, enabling richer client-side behavior and reducing page reload friction for operational users.

- Resolved a persistent bug involving inconsistent validation between frontend and backend layers, then aligned request rules and error messaging so support tickets related to form submission failures dropped by **29%**.
- Improved database-heavy pages by analyzing slow query paths, simplifying relationship loading, and applying targeted indexing changes that reduced average load time by **31%** on several high-usage screens.
- Implemented new features for user dashboards, notifications, and document-driven workflows while coordinating with stakeholders to preserve existing behavior for legacy users during staged rollouts.
- Assisted with migration from older procedural-style PHP modules into cleaner framework-based code, making the system easier to extend and reducing the risk of defects when adding new business requirements.
- Created and maintained internal tools for data cleanup, import automation, and administrative support, which saved manual effort for operations teams and reduced repetitive correction tasks across departments.
- Helped stabilize releases by improving local environment consistency, build scripts, and deployment checks, making it easier for the team to validate changes before promoting them to shared environments.
- Worked across frontend and backend concerns with a flexible skill set, contributing to **React** UI implementation, PHP service logic, SQL fixes, bug analysis, and production issue resolution as product priorities shifted.

Junior Software Developer
Centric Tech Inc. - New Jersey, United States

October 2014 to February 2016

- Supported web application development using **PHP 5.5–5.6**, JavaScript, jQuery, HTML, CSS, Bootstrap, and MySQL, contributing to business portals and internal tools built on broadly adopted patterns of that period.
- Implemented backend features for data entry, user records, reporting pages, and administrative actions while learning how to structure maintainable server-side code within real production delivery cycles.
- Assisted in fixing recurring issues related to malformed form submissions, session expiration edge cases, and inconsistent database writes, improving day-to-day application stability for internal users.
- Contributed to UI enhancements that improved usability on dashboard and form-driven pages, making older screens more responsive and reducing repeated support questions from non-technical teams by **21%**.
- Worked with senior engineers to trace production bugs from logs to SQL statements and PHP controllers, building practical debugging discipline and faster turnaround for small but high-frequency defects.
- Helped maintain release packages, deployment checklists, and environment updates, gaining experience in how careful operational practices reduce avoidable issues after production changes are introduced.
- Improved several slow pages by cleaning up redundant queries, simplifying template logic, and reducing repeated data fetches, which produced noticeable response-time gains for users during normal workloads.
- Supported early integration work with frontend scripting and backend request handling, building a stronger base for later full-stack responsibilities involving both interactive UI behavior and server-side processing.
- Adapted quickly across bug fixing, feature work, SQL corrections, and support tasks, showing flexible engineering habits and dependable execution in a team environment where priorities changed frequently.

EDUCATION

Bachelor's degree in Computer Science
Stanford University Department of Computer Science

2010 to 2014

- Built strong foundations in **algorithms**, **databases**, and **software engineering**, applying coursework through practical team projects and production-style system design.
